# CALENDAR OF GARDEN OPERATIONS

The CALENDAR OF GARDEN OPERATIONS is indispensable and unrivalled, because it represents the accumulated experience of over half-a-century. Originally compiled by Sir Joseph Paxton, it has been revised and enlarged by the staff of The Gardeners' Chronicle until it is now as nearly perfect a gardening guide as any that exists. Its claim to be a 'calendar' is undoubted, as the work to be done is arranged under the heading of each month. It contains also many articles on subjects of horticultural and allied interest, and innumerable excellent illustrations.

Price 2/6, post free 2/10.

THE GARDENERS' CHRONICLE Ltd., 5, Tavistock Street, London, W.C. 2

## DWARF BEDDING DAHLIAS

We have a very large stock of plants in fine condition.

**COLTNESS GEM** The most popular bedding Dahlia. Its brilliant scarlet flowers are produced in the greatest profusion during summer and autumn till frost comes. Habit dwarf and compact, height 18 inches. Plants from pots 12 for 7/-, 25 for 13/-, 50 for 25/-, 100 for 47/6. Carriage paid for cash with order.

**PAISLEY GEM** A new variety of the greatest merit. Flowers brilliant orange-scarlet with a double row of ray florets. It is quite as dwarf and compact in habit, and is even more floriferous than Colt-ness Gem. A decided acquisition which should be in every garden. Plants from pots, 12 for 13/-, 25 for 25/-. Carr. paid for cash with order.

Catalogue of Hardy Scotch Grown Bedding plants may be had post free on application.

**AUSTIN & McASLAN**

# RHODODENDRONS FOR EVERYONE

By F. KINGDON WARD.

PRICE - 3s. 9d. - POST FREE.

This fascinating work, published in 1926, has already proved exceedingly popular, and is rapidly commending itself to the gardening public, many of whose members are finding how much easier is the cultivation of these delightful flowering shrubs than they had imagined. There are very few gardens where they will not grow and flourish with ordinary, common-sense treatment, and their glorious blossoms are a perpetual feast to the eye. Capt. Kingdon Ward writes with authority, for he knows his subject at first hand, having had seven or eight years' experience of travelling in China and Tibet, where he discovered a number of new Rhododendron species.

Send for a copy to-day, to:

AVERAGE MEAN TEMPERATURE for the ensuing week  
deduced from observations during the last fifty  
years at Greenwich, 58.1°.

## ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street,  
Covent Garden, London, Wednesday, June 1,  
10 a.m. Bar. 29.75. Temp. 57°. Weather, Dull.

**The Spring Drought.** THE good gardener combines and practises the philosophies of the Stoics and the Epicureans. Like the former, he "looks on tempests and is never shaken," and like the latter, whose doctrine was propounded in an Athenian garden, the gardener is adept in finding satisfaction in the simplest of pleasures. The former has been known to grumble, but who ever heard of a good gardener doing such a thing? At his worst he but expresses a slightly plaintive regret that the things he is showing you are past their best, or that the weather has destroyed not only his Plum blossom, but many of his fondest hopes. This fund of philosophy has, it is true, been drawn upon very heavily during the past months. For after the havoc of the late frosts the rough winds which shake the darling buds of May have not infrequently consummated the unfruitfulness of his orchards. How tortuous these late drying winds have been every garden demonstrates. The spots which seem to be warm and sheltered, as indeed they are ordinarily, have suffered most. Sweeping round shelters, the winds have dried and shrivelled the Apple blossom on trees which seemed most protected, whilst on others with a freer exposure the blossom has set with

profusion. In this season the vegetable garden, except in well-matured and well-enclosed places, shows itself at a standstill, yet it is doubtful if there ever was a season when flowering shrubs have blossomed more profusely. The Ceanothuses in particular delight every eye with their azure radiance and all the Brooms, white, yellow, parti-coloured and pink, are weighed down with their blossom. Azalea amoena, too, has flowered better than ever before—or so it seems to us—as though to make amends for the sad sight offered by the tender Rhododendrons after the late frost. Other brilliant exponents of beauty are Rosa Hugonis, which seems to find wind and drought to its liking; the best of all the Veronicas, the soft mauve-tressed V. Hulkeana; and, regardless of the cold winds, the Rock Roses produce, day by day, a wealth of blossom, the petals of which litter the paths when the day of flowering is done. Waterside Primulas on the other hand—at all events, those that were put out recently—have hastened prematurely to form puny flower heads, so that the waterside garden is robbed of one of its main glories. Gunneras, on the other hand, though their early leaves were turned black by the frost, are producing a new crop of more brilliant green than is usual. Even the Wistaria which festoons the bridge in the waterside garden which we ourselves are well acquainted with, though most of the blossoms were reduced to sodden masses, now dried by the winds to chaff, are throwing out a second set of flowers, this, it is true, but an earnest of their "will to flower." Caterpillars are, of course, finding the occasion for devastation, and fruit trees which were sprayed in winter with carbolineum, and again in spring with lime-sulphur and nicotine, have every young growth contorted by these pests. The extreme floriferousness of established shrubs and trees and the cessation of vegetative growth of young plants which afford such a striking contrast in the garden are, after all, not so surprising. With the cold wind blowing, and the surface soil dry, young plants in spring soon cease to try to grow. Their stomata shut up, little or no water passes from root to stem, and with the damming of the transpiration stream, growth ceases. But flowers of shrubs seem able to steal from the wood the water that they need for their unfolding and so they blossom in spite of the dry weather. The hoe is the only magician's wand that may avert the worst of calamity during such seasons as these, and where it is wielded constantly, young plants may still be induced to grow a little. Nevertheless, in spite of all we may do, our garden work must inevitably be behind-hand; for there has been no planting-out time, and now we must wait, it may be till autumn, for filling up the bare places in the rock garden and completing the borders. Some districts, of course, have been lucky, and their rain has been sufficient to set growth going, but, in general, the flurry of showers has done nothing at all except to arouse and to dash our hopes that the long spring drought should be at last ended.

**Need for More Playing Fields.**—H.R.H. the Duke of York, President of the National Playing Fields Association, has issued an appeal for funds to enable the Association to provide more playing fields, stating that "Careful inquiries made in different parts of Great Britain by the Association and its county branches reveal a deplorable shortage of playing fields for the young people of the country." The National Playing Fields Association is striving

to make sure that the poorer boys and girls in every city, town and village shall be able to enjoy as a natural right some of the enormous advantages, in this matter of games and playing fields, which accrue to other boys and girls without question, as a matter of course, and to achieve this purpose the Association and its affiliated County and City Associations appeal for the sum of £1,000,000 and land to convert into playing fields. The London and Greater London Committee states that if funds were forthcoming hundreds of acres of land, ideally suited for playing fields in and around London, could be immediately acquired, to the lasting benefit of the youth of London and Greater London. In fact, the definite opportunity presents itself of acquiring areas in different parts amounting in all to some 350 acres at a cost, including laying out, of approximately £160,000. Cheques and money orders should be crossed and made payable to the National Playing Fields Appeal and sent to the Midland Bank, 5, Threadneedle Street, London, E.C.3.

**The Rosslyn Orchids.**—The Rosslyn collection of Orchids founded by the late Mr. H. T. Pitt, at Stoke Newington, and maintained by him in splendid condition over a long period of years, is to be disposed of by the executors at a date to be announced in due course. This sale will provide Orchid specialists with an unusually good opportunity of acquiring many rare and interesting species as well as fine hybrids, notably Odontoglossums and Miltonias.

**Illness of Mr. Alfred Gray.**—The many friends of Mr. Alfred Gray, of Messrs. James Gray, Chelsea, will be sorry to learn that he has had to undergo an operation that will probably keep him away from business for some weeks.

**Children's Gardens Fund.**—In response to Sir Johnston Forbes-Robertson's recent broadcast appeal on behalf of the London Children's Gardens and Recreation Fund, the sum of £178 11s. 9d. has been contributed. Sir Johnston Forbes-Robertson, in the course of his appeal, said the aim was to give each school in the more congested districts a space of garden where, out of the school hours, the children could be in safety. So far they had eight such gardens, containing plots for about 700 children. They hoped to have plots for 1,000 children next year. "By teaching them gardening," he said, "we keep them out of the streets and show them something of the wonders of nature, at the same time giving them the keen joy of possession and the pride of taking home to mother the vegetables and flowers they have grown themselves."

**Why Strawberries are Failing.**—In view of the many complaints of growers in all parts of the country of the deterioration of their Strawberry plants and the poorness of the crop, the remarks of Mr. L. N. Staniland, Advisory Entomologist at the Long Ashton Research Station, delivered at the Shire Hall, Hereford, on May 18, may be of interest to our readers. He is of the opinion that most of the trouble is due to poor selection of runners and methods of cultivation. He considered that growers destroyed many of the young roots or prevented them from forming when they cleaned the beds after the berries had been gathered. In this process soil was pulled away from the plants, the young, delicate roots were exposed to the air, the tips were killed, and other roots prevented from developing. He advised growers, after cleaning the beds immediately after cropping, to earth up the crowns about an inch. Mr. Staniland stated that seventy per cent. of the root system in the Strawberry was found in the top three inches of soil, and of the roots in this three inches about ninety per cent. were active feeding roots. When the soil was worked deeply close up to the plants late in the autumn, these new roots were damaged, and when the roots were damaged or failed to form in August "small leaf" resulted, since the plant was not able to gather food from the soil and was reduced to living on its capital. Damage to the main crown, water-logging, and excessive drought, were

also shown to be responsible for a definite type of "small leaf." Mr. Staniland emphasised the importance of August planting, and stated that September-planted runners were not nearly so good; as the date of planting came nearer to December, the difference was more marked. At Long Ashton, August-planted runners gave a crop of two tons to the acre, whereas September planting only gave half-a-ton. With regard to diseases, including Red Plant and Cauliflower disease, he advocated the growing of a strain of plants which were not liable to the disease, and the roguing of the parent plants before any runners were taken from them. Before planting, he advised dipping the runners in nicotine and soap solution (half-ounce nicotine—98 per cent.—to ten gallons of water), which will ensure freedom from aphids during the first root-forming period. If the plants became infested with aphids afterwards, subsequent sprayings or dustings are necessary. Of varieties, he stated that Lord Overton suffered little from aphid attack, and Madame Kooi suffered most.

**Dr. Wilson Memorial Prize.**—This prize has been founded in commemoration of the work in plant-breeding by the late Dr. John Wilson, of St. Andrews. The prize will be to the value of twenty guineas, and awards will be made from time to time as money is available. The Dr. Wilson Memorial Prize will be offered for work done in Scotland in producing seeds or plants which the Directors of the Scottish Society for Research in Plant Breeding consider to be of value to agriculture in Scotland. The first award will be made towards the end of the current year, and applications for the prize should be sent to the Directors of the Society, Edinburgh, on or before October 1.

**The Transition of Agriculture.**—This is the title of an interesting lecture delivered by Professor C. S. Orwin, M.A., Director of the Agricultural Economics Research Institute, University of Oxford, before the members of the Royal Society of Arts, on March 23. The lecturer stated that transition periods in Agriculture are to be noted all through its history, and the changes introduced in farming practice at these times have been due, all of them, to the need for industrialising the industry. The earliest is represented by the enclosure of the open fields. He dealt with various transitions down to the present time, and showed that on the accession of Queen Victoria the face of the country had undergone an almost complete change. The great fields, farmed mostly in half-acre strips for hundreds of years, as can still be seen surviving in one or two places in England to-day, had given place to the compact fields and farms as they now appear. The development of railways in the New World, bringing vast areas of land within reach of the ports, together with modern methods of agriculture, caused a steady decline of the products of arable land in this country, resulting in driving no fewer than four thousand acres of land out of arable cultivation. During the Great War much of this grass land was once more brought under the plough, but seven years following the cessation of hostilities has sufficed to put it back again, and the position to-day is the same as that represented by 1914, with a tendency for still more land to revert to grass. Professor Orwin stated that agriculture is the second largest industry in the country, and finds employment for some 550,000 workers, but there is a big drift of labour to the towns, for the farmer cannot compete with the employer of industrial labour, and the low economic status which agriculture affords is steadily driving more and more of the best stamp of rural workers to seek other outlets, if not for themselves, at least for their children. According to Professor Orwin, direct State aid for agriculture, either in the form of protection or subsidies, would settle the problem, as is shown in the case of pork, which has enjoyed absolute protection in the endeavour to stamp out foot and mouth disease, and in the Sugar-Beet crop which is admittedly the most profitable arable crop, as a result of the subsidy to home-grown sugar. "There are two possible directions," he said, "in which the bulk of

the agriculture of this country may proceed." The first of these is the steady multiplication of small holdings, the second the development of large scale production, either on light arable farm lands, where the work will be done mainly by machinery, or on strong land grass farms where the labour will consist entirely of stockmen and shepherds. The transition of the present time would be to bring all existing light-land arable farms and all the light-land grazings capable of being ploughed into units large enough to admit of mechanical cultivation in the highest degree.

**M. Joseph S. Mottet.**—Among the most notable and successful raisers of Bearded Irises, Mons. J. S. Mottet occupies a very high position, and this position has been recognised in France, Great Britain and America; indeed, our own Iris Society has especially honoured him in appreciation of his work in this genus of handsome garden plants. As M. Mottet has been a valued correspondent of *The Gardeners' Chronicle*

M. JOSEPH S. MOTTET.

for well over a quarter-of-a-century, it is a pleasure to publish his portrait and a brief account of his horticultural history. Born in Paris sixty-six years ago, his school days were followed by several years spent in the South of France, where he acquired an all-round knowledge of gardening before entering the services of Messrs. Vilmorin-Andrieux et Cie., in 1880, as assistant in the firm's Paris seed shop. Here he remained until 1883, when he came to England and became a student in the old Chiswick Gardens of the Royal Horticultural Society under Mr. A. F. Barron. Here, and during visits to other gardens, he added to his experience and became acquainted with English methods and the English language. He then returned to Messrs. Vilmorin-Andrieux et Cie., and having meanwhile acquired a good knowledge of botany, he was sent to the Verrieres establishment to take charge of the experimental work and the plant collections, where much useful work was, and still is, carried out in the improvement of economic and ornamental plants, especially Wheat, Peas, Beet, Irises and Gladioli. As assistant to the late M. Philippe de Vilmorin, M. Mottet enlarged that gentleman's collection of trees, shrubs and herbaceous plants in his own private park, created a rock garden for him, added much material to the herbarium and assisted in M. Vilmorin's first experiments in genetics. M. Mottet also laid the foundation of a new and important Arboretum in the centre of France, which he still manages. Before going to Verrieres, M. Mottet had undertaken the translation into French of Nicholson's *Dictionary of*

*Gardening*, a work that was enlarged to five volumes, and which he finished in 1899. As an author, he has contributed many useful works on horticultural subjects, notably his *Guide Pratique le Jardinage* (1894); *Les Rosiers* with Mons. Cochet, (1897); *Les Clematites* with Mons. G. Boucher, (1898); *Les Oeillets* (1898); *Les Coniferes et Taxacées* (1902); *La Mosaiculture et l'Ornementation Florale* (1904); and *Les Primevères* (1913), but M. Mottet's most important work is *Les Arbres et Arbustes d'Ornement*, a bulky volume of nearly six hundred pages and over two hundred illustrations, which appeared two years ago. M. Mottet is an Officier du Mérite Agricole, and in recognition of his work as a teacher and lecturer in gardening to country societies he recently received the distinction of "Les Palmes Académiques." M. Mottet's life, as we have shown, has been a full and useful one, but with all his accomplishments he combines modesty, sympathy and generosity, and these fine qualities have endeared him to several generations of the Vilmorin family and their employees.

**Aldenham House Gardens.**—The gardens of Aldenham House, Elstree, will be again open to the public, by kind permission of the Hon. Vicary Gibbs, on the Saturdays of July, August and September (other than Saturday, July 16, the date of the Elstree Floral Fête, when admission will be by payment at the gates); also on August Bank Holiday (Monday, August 1), on the same conditions as in previous years, i.e., that dogs are not admitted, and children are under the control of adults. The gardens are being opened on Whit Monday, June 6, in connection with the Queen Alexandra Memorial Fund, for which purpose an entrance fee of one shilling per person will be made.

**Award of the Snell Memorial Medal for 1926.**—The Council of the National Institute of Agricultural Botany has awarded the Snell Memorial Medal for the year 1926 to Sir Matthew Wallace, Bart. The medal is given annually to mark eminent work in the sphere of Potato husbandry and it has been awarded to Sir Matthew Wallace in recognition of his distinguished services in the improvement of the cultivation of the Potato.

**Forestry in the Scottish Highlands.**—Under the auspices of the Highland Branch of the Royal Scottish Arboricultural Society, whose headquarters are in Inverness, a large party visited, on Saturday, May 28, Mr. Dyson Perrins' beautiful estate of Ardross in Ross-shire. There was a large company, including foresters from Inverness-shire, Ross-shire and Morayshire, Government forestry experts, and many others interested in the subject. Mr. George Anderson, head forester, Ardross, conducted the party, and the expectations of the visitors to this fine estate where so much has been done for forestry, were more than realised. Among the first places visited were seventy experimental quarter-acre plots containing seventy different varieties of Conifers planted in 1910. Great interest was evinced in the experiments, and very valuable information was gleaned as to what may be done for forestry in the Highlands of Scotland. On every side the great work done on Ardross evoked the warmest admiration. At one stage of the proceedings, Viscount Novar addressed the company, reminding them that it was sixty years since he had first visited Ardross, when vast improvements were being carried out. No great work of reclamation in the Highlands equalled the work done by Sir Alexander Matheson when he was proprietor of Ardross, and it is pleasing to note how worthily Mr. Dyson Perrins continues the good work. "My experience of Government work," proceeded Viscount Novar, "was that it compared very unfavourably with the work carried out by individuals," and at the present time, considering the financial position of the country, he thought the less of the Government work and the more of individual work the better. However, the one industry carried on by the State at all well was forestry. He considered a proportion of the country should be under a national scheme, because a national standard was set. In Germany, he reminded his hearers,

one-third of the forestry work was done by private owners, one-third by the Government, and one-third by the local authorities. He would not like to see much forestry land in this country under the local authorities. In Austria, where the management was extremely good, forestry work was undertaken by the hereditary land-owners. But the best forestry school on the Continent was at Prague, the capital of Czecho-Slovakia, maintained by the great landowners of Bohemia. There is still in the Highlands of Scotland, declared Viscount Novar, a wonderful field for the private owners of forest lands. Much of it might be worth very little per acre for sport or pastime, but there is a large area that could be turned into plantations which would yield very large results. During the course of the proceedings the visitors were hospitably entertained by Mr. Dyson Perrins, to whom and his head forester, Mr. Anderson, warm thanks were awarded for the delightful and instructive day spent at Ardross.

**Silver Cup for Paeonies.**—The competition for the second of three Cups presented by Mrs. Edward Harding for the best exhibit of three flowers of each of six varieties shown by an amateur, will take place on June 21, at the Royal Horticultural Society's fortnightly meeting, in the R.H.S. Hall, Vincent Square, Westminster.

**Legacy to a Gardener.**—Amongst recent wills we are pleased to see that the late Mr. Samuel Scott Stanley, Grove House, Roundhay, Leeds, left £400 to his gardener, Mr. John Thackray.

**Changes at the Arnold Arboretum.**—Professor Oakes Ames has been appointed Supervisor of the Arnold Arboretum, and Mr. E. H. Wilson, who has been associated with the Arboretum for twenty-one years and served as Assistant Director for seven years under the late Professor Charles S. Sargent, has been appointed Keeper of the Arboretum, the title of Director having been abolished. Professor Ames has been appointed Chairman of the Council of Botanical Collections of Harvard University, which consists of the Arnold Arboretum, Harvard Botanic Gardens, the Gray Herbarium, the Biological Laboratory and Botanic Gardens in Cuba, the Botanical Museum, the Farlow Herbarium of Cryptogamic Botany and the Harvard Forest of Petersham. Mr. E. H. Wilson is an Englishman, and received part of his horticultural training at Kew. He was a student at the Royal College of Science, South Kensington when he was invited to undertake a plant-collecting expedition in China for Messrs. James Veitch and Sons, Chelsea. Our readers are familiar with his successes in this and succeeding expeditions, accounts of which were published from the pen of Mr. Wilson himself in *The Gardeners' Chronicle*.

**French Honour for Mr. C. H. Curtis.**—The French Minister of Agriculture, when speaking at the banquet given by the Société Nationale d'Horticulture de France, on Wednesday, May 25, announced that the French Government had appointed Mr. Charles H. Curtis, Managing Editor of *The Gardeners' Chronicle*, Chevalier de l'Ordre du Mérite Agricole.

**Brussels International Horticultural Exhibition.**—The "Programme" of the Brussels Show has reached us, and is a booklet of considerable interest in which the actual schedule of classes is a comparatively small part. The exhibition is to be held in the Grands Halls et Jardins du Cinquantenaire, which occupies a fine position in Brussels, from September 10 to September 18. The King and Queen of the Belgians have extended their patronage to this function, which marks the seventieth anniversary of the foundation of the Société Royale d'Horticulture et d'Agriculture de Bruxelles. The President d'Honneur is M. Adolphe Max, Burgomaster of Brussels; M. Eugene Draps, of Uccle, is President of the Directors; M. Francois Roekens, General Secretary, and M. Désiré Draps, Brussels, the Assistant Secretary. Strong Patronage Committees have been formed representing various countries. The Committee for Great Britain includes sixty-three persons,

all well-known in the horticultural world, with Lord Lambourne as President; Mr. Reginald Cory, Mr. H. R. Darlington, Dr. A. C. Hill, Mr. Stuart Low, Mr. H. T. Mason, the Hon. Sir John Ward, and Mr. R. W. Wallace as Vice-Presidents, and Mr. C. H. Curtis as General Secretary. No fewer than thirty-nine countries are thus represented, so that if patronage counts for anything, the show should be a great success. The Belgian National Dahlia Society will hold its show at the same time and place, and arrangements have been made for a conference of the Belgian Federation of Horticultural Societies. The principal groups of classes at Brussels will be for New Plants, Chrysanthemums, Dahlias, Floral Art, Arboriculture, Pomology, Viticulture, Market Gardening, Garden Plans, Horticultural and Botanical Books, Horticultural Implements and Machinery, and Garden Furniture. British horticulturists who propose to exhibit at the Brussels show

might prove interesting, I have sent you the following facts respecting them:—In May, last year, I was requested to plant out one of each sort against a wall having a west aspect; I prepared a compost of peat and loam in about equal parts, in which I planted them; they grew rapidly until late in the autumn, when I began to entertain some doubts as to their safety during winter without protection, but as they were planted for the purpose of testing their hardiness, they were left uncovered, and to my great satisfaction they have stood the winter without sustaining the least injury. *C. papillosus* has been covered with flowers since the middle of April; our plant is about five feet high and six feet in width; *C. dentatus* is now coming into bloom, and is equally full of pretty blue flowers, which are somewhat darker than those of *papillosus*, but not so large; *C. rigidus* does not show any sign of flowering at present, probably it will blossom in autumn.

FIG. 186.—CHELSEA SHOW: DAPHNE AURANTIACA.  
R.H.S. First Class Certificate, May 25. Flowers bright yellow. Shown by  
Mr. A. K. Bulley (see p. 376).

should apply for information to M. Désiré Draps, 62, Rue Médori, Brussels.

**Appointments for the Ensuing Week.**—SUNDAY, JUNE 5: Wakefield and North of England Tulip Society's meeting. TUESDAY, June 7: Royal Caledonian Horticultural Society's meeting. WEDNESDAY, JUNE 8: Royal Horticultural Society's Committees meet (two days); Sheffield Chrysanthemum Society's meeting. FRIDAY, JUNE 10: Leicestershire Agricultural Society's Horticultural show (two days); Manchester and North of England Orchid Society's annual meeting; Royal Horticultural Society of Ireland meeting. SATURDAY, JUNE 11: Dundee Horticultural Society's outing.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Hardiness of Ceanothus.*—Believing that a few observations relative to the hardiness of *Ceanothus papillosus*, *dentatus*, and *rigidus*

One of each of the above kinds was planted out in the open quarter in June, and they also made rapid growth, but they did not stand the winter so well as those planted against the wall. *C. rigidus* stood without the least injury, *C. papillosus* was injured at the points of the shoots, and *C. dentatus* was quite killed. As evergreens for a wall, where such plants are required, these fine *Ceanothuses* cannot be too extensively planted; their beautiful shining foliage and exquisite blue flowers render them objects of universal admiration. *G. Mason, Foreman, Northgate Nursery, Chichester. Gard. Chron., June 5, 1852.*

**Publication Received.**—*The Training and Employment of Educated Women in Horticulture and Agriculture*, by Mrs. Roland Wilkins. The Women's Farm and Garden Association, 29, Park Road, Upper Baker Street, N.W.1. Price 1s.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Oncidiums.**—So soon as the new growths are forward enough, and about to develop new roots, *Oncidium macranthum*, *O. serratum*, *O. undulatum*, *O. superbiens*, *O. monachicum* and *O. zebrinum*, with other members of this large genus may receive attention at the roots; also any that are not flowering this year. On account of the length of time which the flower spikes take to develop, it is essential that the plants should be in robust health, and the rooting material in good condition. Weak spikes are not worth retaining, and should be removed, as if they are allowed to develop they may be the means of the early deterioration of the plants.

**Compost.**—A suitable compost for *Oncidiums* consists of equal parts of fibrous peat, A.I. fibre, *Osmunda* fibre and *Sphagnum* moss, with a moderate quantity of half-decayed leaves added. The compost should be used in as rough a condition as possible, as the fleshy roots of these Orchids will not grow freely through a mass of close material, and for this reason it is advisable to pot them only moderately firmly and grow them in comparatively small pots. Newly-potted plants will not require much water for some time, but as top growth and roots develop, the amount of moisture may be considerably increased. Keeping the compost moderately dry is one of the greatest aids to root-development, and it is advisable to keep the plants on the dry side until they are well rooted. These Orchids need an abundance of fresh air, which causes the pseudo-bulbs to be firm and solid, a very important detail in the cultivation of all Orchids. Frequent overhead sprayings are very beneficial during bright, hot weather, and a great aid in keeping the plants clean. A damp, moist situation in the *Odontoglossum* house the whole year round is suitable for *Oncidiums*.

**Epidendrum vitellinum.**—This cool-house Orchid may need attention; the potting of the summer-flowering variety is best left to a later season. Many failures to grow this plant successfully may usually be attributed to the use of too much fire-heat, or too dry conditions in the house; few Orchids will withstand a lower temperature, provided the compost is in a moderately dry condition. Shallow pans half filled with drainage materials are the best receptacles. Very little moisture is needed at the roots when the season of growth is completed, provided the surroundings of the plants are not excessively dry.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERTREE, Horsley Hall, Gresford, N. Wales.

**Potatoes.**—If the rows are not already earthed up, this work should not be deferred too long, or the haulm will get twisted or broken. A good and safe time for this operation is when the haulm is about eight inches high. Do not make the tops of the ridges too pointed.

**Pumpkins and Gourds.**—These plants may now be put out in their permanent positions and treated similarly to Vegetable Marrows. Later, when fruits have set and are growing freely, the plants should be fed liberally with liquid manure on very frequent occasions, especially where large Pumpkins or Gourds are required.

**Onions.**—Keep a watch for the Onion maggot, especially where it is known to cause trouble. Remove affected plants at once and burn them, then dress the remainder with soot and lime, and do so again on frequent occasions. This mixture will ward off further attacks. Keep the

soil stirred with the Dutch hoe during dry weather.

**Mushrooms.**—At this season it is often difficult to grow Mushrooms without having them severely attacked by maggots, which, in some instances, spoil the whole crop. The fly which lays the eggs and causes the trouble should be destroyed by lightly fumigating the house or shed on several occasions so soon as it is first noticed. Keep the atmosphere of the Mushroom house moist by spraying the walls and floors; also spray a light mist over the beds. Ventilate, and keep the structure as cool as possible. Where beds have been in bearing for a considerable time and are found to be at all dry, an application of weak liquid manure, or a small quantity of salt added to water, will be found very beneficial.

**Endive.**—Where this salad is required early in the season, a small sowing may be made now, followed by fortnightly sowings. If sown too early, this plant is apt to bolt and run to seed. The mossy or curled varieties will be found invaluable for garnishing as well as being useful for salads. The seeds should be sown at this period in a somewhat cool position, on ground similar to that advised for Lettuces. Thin the young plants early, allowing a distance of about ten inches apart for the curled varieties and about fifteen inches for the round-leaved Batavian type.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brocket Hall, Hertfordshire.

**Caladiums.**—*Caladiums* that were started in small pots or boxes are ready for their final potting. The soil should be of a rich nature and open in texture to favour the production of brightly-coloured leaves. When the receptacles are well-filled with roots the latter should be well fed with liquid manure; sheep manure placed in a bag and allowed to soak for several days is a good stimulant and may be used freely. A heavy shade is essential to the plants when producing their leaves, but when the foliage is fully grown a lighter shade will suffice. The *Caladium* delights in a stove temperature and plenty of atmospheric moisture.

**Begonia Gloire de Sceaux.**—Cuttings of this beautiful *Begonia* may be inserted during the next few weeks. Although very rarely seen in gardens, this *Begonia* is a glorious plant when well-grown. Its one fault is that it cannot be flowered successfully in districts where fogs are prevalent.

**Plumbago capensis.**—This Lead Wort is a useful plant for the decoration of the conservatory during the later summer. Plants that were propagated late last season, or during the early part of this year, are ready for transferring to larger receptacles. They will succeed in any ordinary compost, but when they have filled their pots with roots they should be fed liberally with liquid manure and soot-water, and given a concentrated fertiliser occasionally. Continue to pinch out any flowers that may appear for the next few weeks to ensure good, bushy specimens. This *Plumbago* will thrive well in a cool greenhouse. Red spider is very partial to the plant, but by syringing it with clear rain-water the pest may be kept in check.

**Violets.**—These plants should be watered frequently during dry, hot weather. Occasional light sprayings with weak soot-water late in the evenings will also be very beneficial to them during the growing season. Red spider is one of the worst enemies of the Violet, and if this pest is not kept in check by frequent sprayings the best results will not be forthcoming. When the plants are well established an occasional watering with liquid manure will help considerably to build up strong crowns, which are essential for the production of good flowers in quantity. Keep all runners removed as they appear, and stir the soil with the Dutch hoe on frequent occasions, otherwise the surface will become somewhat hard owing to continued sprayings during dry weather.

**Cinerarias.**—Where it is desired to have these plants in flower early in the New Year, a sowing should be made now. The Cactus varieties have become very popular in recent years, also the stellata type, and where large plants are desired for decorating, these varieties are undoubtedly the best to grow. I prefer to sow the seeds in a six-inch pot rather than in a box, for I am inclined to believe they germinate much better in a pot. The receptacle should be clean, well-drained, and filled with a light, sandy compost. Cover the seeds lightly with soil, and stand the receptacles in a cool greenhouse or frame, keeping the soil shaded from bright sunshine. When the seedlings can be handled, they may be pricked off into small boxes; exercise great care in transplanting them, and do not crowd them, bearing in mind that they can be transferred to small pots with less damage to the young roots when plenty of space has been allowed, and, moreover, the young plants will be more robust in growth. Transfer them to larger pots immediately the plants become of a suitable size.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Melons in Frames.**—When hot days are followed by cold nights, the frames should be protected at night by a covering of mats or some other material. Top dress the roots with good loam mixed with lime rubble and a little bone-meal as often as they appear on the surface. Pinch the laterals at the first joint until female flowers show in plenty and the plants are strong enough for cropping; pollenate the flowers daily. If early plants in pits or frames have not done well it is best to make a fresh start with robust seedlings. The linings of fermenting materials will require careful renovation, at the back and front of the frame, to obtain the necessary bottom-heat.

**Cucumbers.**—By the maintenance of a steady temperature both night and day, and regular attention to closing the lights early, with plenty of sun and moisture, a constant supply of Cucumbers will be forthcoming from pits and frames. The secret of getting sweet, crisp fruits in frames is quick growth. From this time forward, the difficulty of removing the lights for pinching and regulating the growths is easily overcome by doing it early in the day, and this work should always precede watering or syringing, before finally closing the frame for the day. Frame Cucumbers are apt to become crowded later in the season, therefore thin planting and stopping the shoots at the first joint beyond the fruits are necessary. As the plants become well-established, the supply of stimulants at the roots should be liberal.

**Mid-season Grapes.**—The development of the Grapes in mid-season vinerias may be hastened by timely and liberal thinning of the bunches, by ventilating early in the day, and closing the house when the temperature is fairly high from sun-heat. Maintain an abundant supply of atmospheric moisture, and damp the bare spaces with diluted liquid manure. Inside borders that are well-drained can hardly be over-watered at this stage, but the water should be as warm as that used for syringing, and soft, if possible. Guano dissolved in water hastens the development of the foliage, soot water gives it colour, while liquid manure contains nearly all that healthy vines require. Late varieties, such as Lady Downes and Alicante, are rather later than usual, but the berries have set well. As late Grapes quickly reach the stoning stage, watch closely for scalding, a trouble to which Lady Downes and Muscats are subject. Keep the roots of the vines warm and growing actively, guard against low night temperatures, and a stagnant atmosphere; also see that the temperature does not rise too high with sun-heat before the house is ventilated in the morning. The stoning stage only lasts about a fortnight, and with warmth from the pipes night ventilation is possible with a fairly brisk temperature in which the berries will not be covered with

condensed moisture. These measures, with liberal ventilation should prevent the temperature from becoming too high during the day, and too low at night.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

**Morello Cherries.**—Trees growing on north walls are looking exceedingly well and full of promise for a good crop of fruit, but of this the grower can never be sure until after the stoning period. The management of the Morello Cherry on walls, including the training of the shoots, is very similar to that adopted for the Peach. All outgrowing and over-luxuriant shoots should be stopped if they cannot be spared, and any that are not wanted rubbed off entirely; it is best to carry out this removal of shoots on several occasions during the early stages of growth, as the removal of many on one occasion would give a check to the tree. The young growths may be trained over some of the older branches to take their places at a future period, for it is necessary to cut out some of the older branches in the autumn and train in a number of young growths to keep the wall furnished with healthy, young, fruitful shoots. Insect pests, such as black fly, should be checked so soon as they make their appearance, by spraying with Quassia extract, or some other suitable insecticide. If the trees are not too crowded with growth the fruits will hang on the trees until late in the autumn.

**Mulching.**—Young, vigorous trees, and those that are bearing light crops but making robust growth, will not need mulching, but where the land is light, resting on sand or gravel, heavy mulchings, applied early in the season, are most beneficial to fruit trees. Trees worked on shallow-rooting stocks and growing on walls, also bushes, etc., should be mulched first, and especially those that are carrying heavy crops. Rich, well-rotted farmyard manure should be applied, and the application followed by a good soaking of water so that every portion of the soil in which the roots have penetrated is well moistened.

**Removing Root-suckers.**—All suckers arising from the roots of fruit trees should be removed, as they weaken the trees considerably. Plums are most troublesome in this respect, but Cherries and Peaches growing against walls sometimes develop suckers, which need to be dug up very carefully; cutting them off with a hoe is not of much use as buds that are left develop later.

### THE FLOWER GARDEN.

By JOHN COURTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Roses.**—Green fly has proved rather troublesome on Roses this spring, especially on the rambler varieties, and prompt measures should be taken to combat the pest, which quickly ruins the plants. A nicotine spray is the most effective specific for green fly. A sharp outlook should also be kept for mildew on Roses and, if detected the plants sprayed with one ounce of liver of sulphur to three gallons of water, increasing the strength to half-an-ounce in one gallon of water when the foliage is matured.

**Summer Bedding.**—All the plants intended for the summer display should be put in their flowering quarters so soon as possible, starting with the hardier subjects first, and following with the more tender plants later. Some districts are more subject to late spring frosts than others, and this must be taken into account in setting all tender plants in the open. All plants should be well hardened and soaked at the roots before they are bedded out. Biennial plants raised from seeds, including Wallflowers, Myosotis, Silenes, Pansies, Violas, Daisies, Cheiranthus Allionii, Foxgloves, Verbasiums, Hollyhocks, Geums and such like subjects, may all be sown from the beginning of June until the end of that month, the time varying according to the locality. It is a mistake to sow such subjects as Cheir-

anthus, Myosotis and Silenes too early, as in certain districts large plants winter badly; in fact, in the immediate neighbourhood of London it is impossible to winter Myosotis and Silenes unless the plants are quite small. Wallflowers and Cheiranthus Allionii also prove very troublesome if at all overgrown, and, I understand, the same difficulty is experienced in the neighbourhood of most large manufacturing towns. Generally, the seeds may be sown thinly in lines in the nursery garden, although it is wise to sow choice varieties in boxes in cold frames. It may be necessary to shade the seed-beds during very dry weather, until germination takes place, and this is usually best done with branches of shrubs and trees. The new race of winter-flowering Pansies is well worth growing, and if seeds are sown now the plants will flower before planting out time, making it easy to pull out any rogues or discard poor forms.

and the bulbs sorted into various sizes, to be again repotted early in August, but in the case of the Nerines and Lachenalias, splendid results are obtained by keeping them in a pot-bound condition, and only breaking them up when it is desired to increase the stock.

**Chrysanthemums.**—Plants of the late-flowering section of Chrysanthemums which are now well-established in six-inch pots should be placed in the pots they are to occupy finally. For this potting a generous compost should be prepared, and slow-acting manure, such as bone-meal, added in the proportion of a six-inch potful to one barrow-load of the compost. Where the stopping or pinching of the young growths was attended to early in May, the side-shoots that developed subsequently will now be growing freely, and thus little or no check will be given to the plants, which should be potted

FIG. 187.—SILVER WORK OF ART PRESENTED TO THE SOCIÉTÉ NATIONALE D'HORTICULTURE DE FRANCE BY THE ROYAL HORTICULTURAL SOCIETY AND AWARDED TO THE AALSMEER GROWERS. (see p. 403).

**Bedding Schemes.**—The plans for next year's spring bedding should be decided now, while the successes and failures of the past season are fresh in mind, and to allow plenty of time in which to raise the necessary stock. Where large quantities of spring-flowering bulbs are used, the order for the bulbs should be placed as early as possible.

firmly, using a rammer to compress the soil around the ball of roots. A space of about two inches should be left in the top of the pot for future top-dressings as the season advances, and the plants set out in their summer quarters, which should be clear from over-hanging trees, or other shade, so that all the sunshine may reach them.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Nerines, Lachenalias and Freesias.**—These natives of South Africa are approaching their resting period, and so soon as the foliage turns yellow, water should be gradually withheld at the roots until they are quite dry. To complete the thorough ripening of the bulbs or corms they should then be placed on a sunny shelf in full exposure to sunshine, where drip or damp will not reach them. When perfectly ripened the Freesias should be shaken clear of the soil

**Kitchen Garden.**—The earliest-raised plants of Brussels Sprouts and other Brassicas are ready for planting in their permanent quarters, which should be done at the first opportunity. Where these plants were set out two or three inches apart in nursery rows, they should be lifted carefully and replanted with a trowel, so that they may receive the least possible check; Cauliflowers especially are peculiarly sensitive to a check to growth, and the cause of "buttoning" may frequently be traced to careless handling at planting time. Where large quantities of Brussels Sprouts are grown, it is a good plan to plant Cauliflowers or Early Cabbages in alternate rows, so that when these have been cleared, the Sprouts will have plenty of space,

## ALPINE GARDEN.

### ONOSMA ALBO-ROSEUM.

THIS delightful little plant never looks better than when well clustered on the rock garden, where the beauty of the drooping, pearl-like flowers may be fully enjoyed. I find that this plant needs a very dry situation, and it enjoys an abundance of grit and stone around its collar. The soil should be well-drained and consist of very sandy loam. A position in full sunlight should be selected for this plant. The hoary foliage is charming, even in winter, and provides a delightfully pretty setting for the pendent flowers; these are, when first open, ivory-white, but they quickly acquire a slight suffusion of pink. The plant is, however, rather variable in colour, the suffusion occasionally being of a red or purplish hue.

Excessive damp may prove inimical to this species; therefore, it should be planted in a well-drained, gritty soil, and a high situation. Propagation is easily effected by cuttings.

*O. albo-roseum* is a good companion to the better-known *O. tauricum*, and both species are possessed of more than ordinary beauty. *O. albo-roseum* flowers in the early summer. *Ralph E. Arnold.*

### VERONICA GENTIANOIDES.

THIS beautiful member of the Speedwell family, which was introduced from the Caucasus in 1748, deserves a position in every garden, serving as an excellent subject for both the rockery and herbaceous border, not only for its free-growing qualities, but, perhaps, more so because of the profusion of blossom produced at this period of the year.

When in bloom, *V. gentianoides* appears at a distance like a soft mass of grey-blue, producing a wonderful restfulness to the eye.

The racemes of grey-blue flowers are borne on elongated stems, attaining a height from six inches to twelve inches, or more. The leaves are of a light green colour and radiate outwards, covering the ground. *V. gentianoides* succeeds in almost any good, rich soil, provided suitable drainage is assured and a sunny position afforded the plant.

Propagation is easily effected by division of the roots in spring or autumn.

There is a white and variegated form, but neither excels *V. gentianoides* for general effect. *T. D. Boyd.*

## IRIS GARDEN.

### PLANTING FLAG IRISES.

THE members of the various sections of the so-called Flag Iris may be successfully planted or transplanted over a long period, varying from autumn to spring. There is, however, little doubt that the best time to transplant is immediately after they have finished flowering, as that period coincides with the production of new roots; the plants thus become well-established before the winter, and there is every prospect of them producing a full crop of flowers the following season.

Irises are good plants for town gardens, the stronger-growing varieties, at least, succeeding under very adverse conditions, both as regards soil and situation. Like all plants, they repay for good cultivation, and generally do best in a good, fertile, well-drained loam. Where large collections are grown, it is essential to transplant them in fresh ground from time to time, or renew the soil in the beds or borders, as fresh soil is the best preventive of disease.

The beds should be prepared thoroughly and enriched with well-decayed manure and bone-meal, the latter at the rate of six ounces to eight ounces to the square yard. A similar dressing of basic slag should be given, autumn being regarded as the best time to apply this fertiliser, but there is no reason why it should not be applied when the beds are being prepared

for planting. In replanting, care should be taken not to set the roots too deeply; the rhizomes should be covered with no more soil than what is necessary to keep them in position. If these Irises are planted carefully and well watered afterwards in dry weather they will soon become established in their new quarters. *J. C.*

## PALESTINE AND FLORENTINE RANUNCULUS.

I READ with pleasure, in *The Gardeners' Chronicle* (page 345), that an Award of Merit has been granted by the Royal Horticultural Society to a new strain of improved Palestine *Ranunculus*, shown by Messrs. Watkins and Simpson. It may be thought that this strain, raised by myself, has some affinity with my old one, known under the name of Giant Florentine, that obtained an Award of Merit at the Wisley trials two years ago.

The new strain, shown now for the first time, has been raised by myself, by careful selection, continued for fifteen years, from a single scarlet variety from Palestine; its double or semi-double flowers are not so large as those of the older giant strain (known also as *Rosellina di Firenze*), but the colours are brighter and include some shades of red and scarlet, colours unknown in the Florentine race. This is a good example of improvement by means of culture and selection.

By the kindness of Professor Pampanini, I received from the Botanical Garden of Florence, some roots of a dwarf *Ranunculus asiaticus*, with yellow flowers and peculiar foliage, he had collected growing wild. As for many years I was anxious to investigate the origin of the varieties of the so-called *Ranunculus africanus*, Hort., I thought that this was a good occasion for making experiments. I submitted these roots to the same treatment I had employed for those from Palestine, but after seven years of effort, not any improvement had appeared. Therefore I gave up the experiment. There is a striking contrast between the behaviour of the other from Palestine, that, in the third year of sowing, had increased the number of petals, and in the fifth has shown new shades of colours. But Nature has her secrets! *Dr. Ragionieri, Castello, Florence.*

## THE GLADIOLUS.

(Continued from page 358).

I do not think it invidious to state here that the late James Kelway, by his constant zeal and untiring efforts in their culture and hybridisation, became known as one of the greatest authorities on Gladioli, or that the rapid improvement which he brought about in colour, markings, size of flower and length and compactness of spikes was really wonderful, or that he laid deep and wide the foundations of the present popularity of the flower. Would that he could have lived to see it. He was a most untiring and indefatigable worker; early and late, his time was devoted to his great speciality, under considerable difficulties as to soil.

I have his diary, filled, perhaps unfortunately, not with notes of interesting people whom he must have met, or of social or political or scientific events of his time, but of what he himself did, or caused to be done, day by day, month after month, year after year, for nearly fifty years, in respect of the cultivation and exhibition of Gladioli. Those were the days when labourers reared families on 9s. to 11s. per week! Horsed coaches took James Kelway, John Keynes and other veteran champions many a weary mile through the cold nights from country nurseries to the Crystal Palace and South Kensington, with their Dahlias, their Hollyhocks, or their Gladioli packed in the "boot." Great were the jublations here year after year at the list of successes won, and equally great the consternation on one or two occasions

when the Scotsmen came down from the north late in the season and "wiped James Kelway's eye." Then in 1878 and again in 1889, the Langport Gladioli were taken to Paris and beat the Frenchmen on their own ground. Altogether many hundreds of first prizes were collected from all parts, and afterwards many scores of cups and gold and silver medals for non-competitive exhibits.

Regularly each season many certificates were awarded to the Kelway novelties. The glorious varieties were, it seems to me, speaking from recollections of things of my early youth, as fine as those of to-day, at least in length of spike and delicate beauty, although certainly not in the markings and wide range of colour, nor in variation of colour in the same flower, nor in the breadth of flower. Spikes then carried twenty-four pips, eighteen or twenty open at once. But all those varieties are gone, like "the snows of yester year," as those we know to-day will also disappear. The "life" of some kinds is longer than others. I recollect that the famous "Duchess" (of Edinburgh) remained for about thirty years, but few hybrid varieties seem to last more than for ten to fifteen years. Of the fine sorts sent out by John Burrell none had a lengthy existence.

According to present day tastes, which are more florid, the old method of exhibiting left much to be desired. Tube-shaped, metal cups were inserted in three rows of holes made in the wooden box in which the spikes travelled by train, with brass rods inserted at the corners and ends and joined by horizontal rods against which the spikes, with their own foliage, were tied, each spike trussed to a green stick. A big exhibit looked like rows of red-clad soldiers in line; for red and bright rose were the predominant colours. Arranged like this, with water in the cups, the flowers travelled and arrived fresh so far as Dublin and Dundee, and even Paris. The boxes and cups were painted green and there was nothing to distract attention from the flowers. Nowadays one admires the beautiful gilded baskets or other ornamental holders, with ribbons and a variety of alien foliage, almost as much as the flowers. Very beautiful is the effect of such elaborate exhibits for instance, as Mr. Unwin's of Histon, last year. The Gladiolus is certainly a rather difficult flower to exhibit. The mean between stiffness and floppiness, starkness and over-elaboration of ornament is not easy to attain with it. I remember that we used to travel with the great boxes to see that they were not tipped up, sitting on them on the deck of the boat for Paris, the boxes having painted on them, "*Tenir ce cote en haut*," which was our French for "This side up." During the non-palmy days of the R.H.S. ours was sometimes almost the only exhibit at South Kensington. Now one is liable to get crowded out.

The trade in Gladioli grew, until from eight acres in 1877 we planted at Langport about forty acres every year, and a large, massive warehouse was built in which to store the corms. Some of the flat, alluvial, low country near Langport gets flooded each winter; James Kelway thought it would make good bulb land and had some acres ploughed and planted. Alas! floods that year came in the summer, and two or three acres of valuable stock could not be lifted, and was totally lost. My grandfather used to go to great trouble and expense in the cultivation of our heavy soil, placing pure yellow sand of local origin under each corm. The damming of the brook and washing of the corms at lifting time was a necessary, arduous, and rather picturesque operation. The men always called them "Gladylis," or more familiarly and simply, "roots."

James Kelway paid a visit to Souchet, at Fontainebleau, just before the Franco-German War of 1870-71, and was very "bucked," as we might say now, to find Souchet's house called "La Villa Glaieul," his own dwelling having carved on the entrance pillars the words, "Gladioli Villa," as it has to this day. During a second visit after the war, he was informed that the stock of corms had been boiled to make soup! *James Kelway.*

## FEED YOUR FLOWERS with FISON'S FERTILIZERS

SOLD DIRECT TO THE PUBLIC—CARRIAGE PAID

Herbaceous borders, in common with Roses, Chrysanthemums, Delphiniums and Asters, etc., respond very readily to Fisons'

### CANARY GUANO

a scientifically compounded and perfectly blended General Garden Fertilizer. 7lbs. 3/6; 28 lbs. 10/-; 1 cwt. 32/- Carr. paid.

To maintain turf in the best condition throughout the summer, Lawns should be fed with Fisons'

### LAWN GUANO

as used by many of the leading Tennis Clubs. 7 lbs. 4/-; 28 lbs. 11/-; 1 cwt. 33/- Carriage paid.

The most nourishing and economical food for use in the Vegetable Garden is Fisons'

### CHAMPION FERTILIZER

7 lbs. 3/-; 28 lbs. 8/6; 1 cwt. 26/- Carriage paid.

JOSEPH FISON & Co. Ltd.  
IPSWICH.

Fertilizer Manufacturer to H.M. The King

## WILLIS BROS.' Garden Fertiliser

THE BEST ON THE MARKET.  
NO STABLE MANURE REQUIRED.  
For digging in or as a top-dressing. For kitchen Gardens or Herbaceous Borders.  
1 cwt., 15/-; 1/2-cwt., 8/-; 28lb., 5/-; £14 10/- per ton. All Carriage Paid.

### UNIVERSAL SOLUBLE MANURE.

FOR FRUIT AND PLANTS.  
Used in the Public Parks and Gardens for flower beds, etc. A scientific combination of all the valuable manurial agents best suited to plant life. The best Concentrated, All-round Manure in use.  
1 cwt., 25/-; 1/2-cwt., 13/-; Carriage Paid.

### QUASSIA COMPOUND.

Liquid Quassia Extract, etc., the cheapest reliable Insecticide known. Mixes instantly with water, and leaves no deposit. May be used with perfect safety.  
1 gal., 7/6; 5 gals., 25/-; 10 gals., 65/-; carriage paid.  
1 gallon makes 40 gallons with water.

### NICOTINE INSECTICIDE.

“Highly Concentrated.” Full directions sent with each package. A good spring dressing for fruit trees, and for general use under glass. Soluble in water.  
1 gal., 15/-; 1/2-gal., 8/-; 5 gals., 70/-; carriage paid.

### NETS! NETS!! NETS!!!

Best Heavy Tanned Garden Nets, 1" mesh. For Strawberry Beds, etc. 8x25 yds., 27/6; 50x4 yds., 27/6. Carriage Paid.

New Netting, 1", 2" or 3" square mesh. Carriage Paid. Samples and Prices on application.  
Tarred Tennis Stop Netting, prices on application.  
Melon Nets, 12x12, 8/6 per dozen.

### GREENHOUSE BLINDS.

Made up to any size from special quality white shading material. Bound all round and down centre for strength with stout webbing, ready to fix; or complete with Rollers and Fittings at small extra cost.  
Estimates and samples on application.

GARDEN SUPPLIES AT LOWEST PRICES  
Writes for our List of Garden Manures and Horticultural Sundries. Free on application.

## A REVISION OF VIOLAS.

(Continued from p. 357.)

*V. CANINA*.—Under *V. canina*, Farrer has grouped a number of forms of Dog Violets which are distinct. The name *V. stricta* has been made to do duty for both *V. elatior* and *V. persicifolia*—both grown in English nurseries, the former of which received an Award of Merit last year. *V. Ruppilii* is a synonym for *V. montana*, a sub-species of *V. canina*, while *V. Hornemannii* is simply *V. elatior*. *V. lancifolia* or *lusitanica* is a synonym of *V. lactea*, the representative of *V. canina* on the Atlantic shores of Europe. *V. Jordani* is a distinct species, common in the French Riviera. *V. stagnina* should be known as *V. persicifolia*, Roth., under which name it is grown at Kew. It is a rather slender counterpart to *V. elatior*. *V. Schultzii* is an unimportant variant of *V. montana*, which is not peculiar to Alsace but is found here and there, as in the Euganean Hills near Venice, and as far distant as north-east Siberia. *V. pumila* is a distinct species which may be traced in catalogues under the synonym of *V. pratensis*. All these Dog Violets are nearly akin to the type, *V. canina*, except *V. elatior* and *V. persicifolia*, which, in their erect, tall habit (almost like stalks of Mint), are very distinct.

*V. cenisia*.—Both Becker and Burnat, than whom there are no more trustworthy authorities, give this as a purely limestone species. They give no instance of it occurring off the limestone. It appears to grow well enough in pots in frames, seemingly indifferent as to soil, but the difficulty is to get it to blossom and to carry it over the winter. Taking a cue from Nature, it cannot be a pot plant; its roots ramify in all directions, the plant erupting into leaves over a wide space, wherefore a very roomy sand trough seems to be indicated, wherein the roots may have liberty to ramble as they will. I have seen *Campanula alpestris* (Allioni) growing like a weed in just such a receptacle, poking out its flowering shoots in an unexpected direction. Farrer describes *V. cenisia* uniformly as purple; but its authentic description is caerulean or sky-blue, which is the only form in which I have found it on the Mont Cenis. Farrer's account also suggests that *V. cenisia* is at least slightly downy; on the contrary, its typical form is entirely glabrous, as in Switzerland; while as its area goes southwards it becomes more pubescent, until on the frontiers of the Cottian and Maritime Alps it is entirely minutely pubescent. Mr. Gavin Jones has collected near the Argentera Pass a form which is hardly distinguishable from, and may be, *V. diversifolia*, a species which is densely pubescent, and is normally confined to the Pyrenees. The Pyrenean species belongs to the *Valderia* group, being separated from the *Cenisia* Violas by its taller and more tufted habit as well as by the greater division of the stipules. Its typical Pyrenean form is *V. diversifolia*, W. Beck., which Farrer correctly describes under the names *V. Lapeyrousei* (*sic.*, *Lapeyrousiana*) or *vestita*. They are "probably one," he states, which is the case; the former being the name given by Rouy and Foucauld, and the latter that given by Grenier and Godron. Farrer also states that *V. Comolia* and *V. valderia*, though reckoned as mere varieties of *V. cenisia*, will always be treated by the gardener as separate species; in this he anticipated the botanists, who not only now regard them as separate species, but even separate *V. Comolia* as belonging to the *Cenisia* group from *V. valderia* as belonging to a group of its own.

Natural hybrids of the *Cenisias* are very infrequent, but a very notable one is *V. cenisia* × *V. calcarata*. To this has been given the name of *V. Jaccardii*, after Professor Jaccard, who first discovered it at the base of the Lämmern Glacier in the district between the Gemmi Pass and the Winter Sports resort of Adelboden. Dr. Schinz, of the Zurich Botanical Gardens, tells me that there is little hope of its being re-discovered; but at the same time Dr. Jenkin, of Hindhead, has it in his garden, having been collected by him inadvertently on Mont

Cenis. I am informed by Dr. Jenkin that the hybrid both grows and flowers with more vigour than either of the parents—in which case it is a discovery of the highest merit. *E. Enever Todd, Lt.-Col.*

## TREES AND SHRUBS.

## SALIX VITELLINA PENDULA.

For the last two years I have been trying to find out what Willows have been named *S. babylonica ramulis aureis*, but those I have seen under that name were *S. vitellina pendula* from Westonbirt and Wisley. At Kew Gardens it is under its correct name. I have seen it elsewhere without name. The first record of this weeping Willow was in Späth's Catalogue, No. 69, p. 110 (1888), and it is said to be often

monoecious in all or nearly all cases, instead of being dioecious as in Willows generally. In one case I found a hermaphrodite flower, one ovary and one stamen being side by side in the same bract. The tree is at all times highly ornamental, and in 1926 was in full bloom in February. *J. F.*

## CERCIS SILICUASTRUM.

THOUGH the Judas Tree has been known to English gardens for three hundred years, it is by no means so often seen as it might be, and this is the more remarkable when one realises that it is quite hardy and grows well in light loam and a sunny situation.

*C. Silicuastrum* is a deciduous species, with smooth, glaucous green, heart-shaped leaves. The flowers are produced in clusters at the joints of the older wood; they are a bright rosy purple and are usually borne with the greatest profusion on every branch and even upon the trunk. As a rule, seeds are yielded in plenty, the long,

FIG. 188.—CHELSEA SHOW: ASTER ALPINUS VAR. SHIRLEY.  
R.H.S. Award of Merit, May 25. Flowers bright mauve. Shown by Messrs. B. Ladhams, Ltd.  
(see p. 377)

sold under the name of *S. babylonica aurea*. Presumably it is also sold as *S. babylonica ramulis aureis*. It is a very singular Willow in being either androgynous or gynandrous, for the catkins may be nearly all male, or nearly all female; or the catkins may be of one of these sexes chiefly with a scattered few of the other sex in the same catkin. It is evidently of hybrid origin, and not a variety of the true *S. vitellina*, which is also regarded as a hybrid by many botanists. If I were to suggest the parentage it would be *S. babylonica* × *S. vitellina*. I come to this conclusion from the fact that the leaves are narrower, the branches more slender, the catkins much shorter and more slender, and the bracts of the catkins much shorter than in *S. vitellina*. This comparison has been made between the young trees of *S. vitellina pendula* in the R.H.S. Gardens at Wisley and trees of *S. vitellina* in various parts of Surrey and Middlesex, which include one male and many female trees. An examination of the catkins shows that *S. vitellina pendula* is

brown pods remaining on the branches until the following year, and when one considers how easily this tree can be propagated from seeds, one is again surprised that it is not more popular.

The Judas Tree is a very conspicuous object in the gardens and streets of Italy and southern France throughout the month of April, but here it is generally considered a May-bloomer. When I was in the Esterel Mountains a few weeks ago, I saw nothing more beautiful than the quantities of Judas Trees, which are naturalised in some of the valleys of that romantic part of France. All were in full and abundant bloom. They grow along the stream-sides in places as thickly as Alder bushes, filling the glens with a lovely rosy flush. In spite of the poor, rocky soil in which they grow, many of these trees had been well over twenty feet in height, but all the older specimens had been destroyed by forest fires, the present crop being seedling saplings and basal shoots. *A. T. Johnson.*

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden W.C. 2.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Editors and Publisher.**—Our correspondents would oblige delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, &c., but they cannot be responsible for loss or injury.

## MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA\*

### XI.—THE ALPINE CAMPS.

AND now for the June Primulas. On the first day at the lower alpine camp (June 2), I followed a flock of sheep across the great snow-drift beneath which the roaring Seinghku was rapidly driving a large tunnel. A vast cone of snow filled the rocky glen above, affording easy access to the cliffs, and up this slope the sheep plodded to nibble at the scarcely visible pasture above. On one flank of the snow cone was a high, bare-looking earth bank, and my attention was at once drawn to it by a glimpse of a large bright pink flower, almost flush with the ground. I thought at first that it must be a new kind of Rose, but when I reached it I found it was not a flower, but a head of flowers, belonging to a glorious *Nivalis* Primula, which I promptly christened the Tea Rose Primula. Imagine my astonishment on learning later that this glorious plant was none other than *Primula muliensis*, a species found years ago by Handel-Mazzetti, in a much drier country 200 miles east of the Seinghku as the wind blows! However, at the time, I did not know this, and I revelled in the joy of discovery; never had I seen so wonderful a Primula, opulent, glowing, and of a much pinker pink than *P. rosea*.

*P. muliensis* reminded me straightway of the delicious *P. falcifolia*, the Daffodil Primula of Tibet, and was as pure pink as that was pure yellow, whereas the vast majority of *Nivalis* are purple or violet, and *P. chionantha* is white. But *P. falcifolia* has only one, or sometimes two flowers, and *P. muliensis* bears six or eight, in a tight, spherical truss; also *P. falcifolia* is fragrant and *P. muliensis* is not.

Here, then, was *P. muliensis* fairly abundant on both sides of the river, but quite local. It flowers at the beginning of June before the strap-shaped leaves attain any length, growing in the open on earth banks and grass slopes at the foot of gneiss cliffs, sinking its long roots and Onion-shaped crown deeply into the loose, stony soil; but although keeping to the open, it hugs the shadows. Throughout the summer it lengthens out, but meanwhile the surrounding vegetation has grown up, and by the autumn it is smothered, and difficult to find in seed. The strap-shaped leaves are rather fleshy, dark polished green above, silver beneath. The capsule is of the rather spherical, crumbling

type, as seen in *P. falcifolia*, not the narrow, cylindrical box, crowned by teeth, met with in *P. Coryana*, for example; but the seeds are of the typical tuberculate mahogany brown *Nivalis* type.

So far as I know, *P. muliensis* is not in cultivation, and as Professor Wright Smith considers it one of the three most lovely Primulas in the world, it is to be hoped that it can be raised to flower in this country. Seeds of it have at any rate, germinated.

The next Primula to catch the eye was *P. eucyclia*. The type specimen found by Mr. Forrest's collectors is described as "pale shell pink," probably from a dried specimen, and is said to come from 14,000 to 15,000 feet altitude, which is, I fancy, about 4,000 feet too high for it, if only for the reason that at the season when it flowers, namely, May, the mountains at that

The mauve, or violet flowers are very deceptive, as most of the Geranioides section, to which this dwarf is referred, such as *P. latsecta* and *P. septemloba*, run decidedly more to red than to blue; and if Mr. Forrest did guess at the colour of his plant from a dried specimen, he had every justification for saying pink rather than mauve.

Another common, early species was *P. euosma*, one of the Petiolaris section, which includes the now well-known *P. Winteri*. *P. euosma*, which is widely distributed in the Burmese Alps from Hpimaw to the Seinghku, is a feeble, pallid edition of *P. Winteri*, and a still feebler and more pallid edition of *P. sonchifolia*; but to see the bare earthen slopes, from which patches of snow have just melted, dabbled over with the blue flowers and green rosettes of *P. euosma* is a joy. It is not likely to supplant *P. Winteri* in cultivation, but it might supple-

FIG. 189.—"WATERFALL CLIFF" COVERED WITH DWARF RHODODENDRONS, ILEX, ETC. PRIMULAS GROW IN THE VALLEY AT THE BASE OF THE CLIFF.

altitude are under five feet of snow. I found beds of *P. eucyclia* laid over a foundation of spongy moss, growing in deep shade under trees where water splashed and dripped down the cliff from the snow beds above; rarely does it venture to approach the open, and when it does it hardly flowers at all. On the other hand, though it flowers profusely under the rocks and Rhododendrons it loves so well, it ripens hardly any fruit there, which is really not surprising.

In my experience the flowers are either mauve or violet, with yellow or red "eye," and the plant does not occur above 11,000 feet, being most abundant at about 10,000 feet. Though I met with it on both sides of the river, it was quite local in the Seinghku valley, and was usually associated with *Magnolia globosa*. *P. eucyclia* is a charming plant, and it might be possible to grow it in beds of moss in the rock garden; it is more compact, and has larger and better-coloured flowers than its near Himalayan relative, *P. vaginata*.

ment it, since we have nothing to hope for from *P. sonchifolia*.

On June 12, we started for the new hut, the kit being carried by yaks and coolies. The monsoon had, by this time, set in properly, and a persistent drizzle assailed us.

A short distance above our camp we began to climb steeply, usually marching over the great snow drifts; the conditions were truly alpine, there being only patches of Fir forest on the slopes, none in the valley itself. Open meadow or turf alternated with dense scrub, consisting chiefly of Rhododendron, with several species of Acer, Viburnum Wardii, Enkianthus, Salix, Pyrus, Lonicera, Rosa sericea, Cotoneaster, etc. The wealth of Lonicera seen in the forests of Tibet was lacking here, and I noticed only two species with rather inconspicuous flowers; instead, there were six or eight species of Acer, one in particular being a handsome tree, very striking in fruit. A Pyrus with large, polished leaves, the leaflets rounded at the apex, was also worth noting. (K.W. 6,851).

\* The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1926, and January 1, February 19, March 5, 19, and April 9, 30, 1927.

The rain now came down harder than ever, and the snow drifts, concentrated in the narrow valley, made it very cold, which was no doubt the reason why there were so few flowers here, though the higher slopes glowed with Rhodo-

is a plant of the open meadows, not of the woodland glades. In July the meadows were azure with its great, floppy heads; it grew in thousands and flourished exceedingly. Like *M. Baileyi*, it is, I believe, polycarpic.

FIG. 190.—RHODODENDRON THOMSONII IN FLOWER, WITH ABIES FOREST IN THE BACKGROUND.

dendrons. There was promise of much later on however. Two more species of *Primula* call for remark. One was clearly a small 'Candelabra' of the *P. serratifolia* type, usually producing no more than one whorl of bicoloured flowers, the colours arranged concentrically, as in the common Primrose, instead of in stripes, with a dark bullseye and a pale "outer." By the middle of July this was in full bloom everywhere, and I have never seen a *Primula*, 'Candelabra' otherwise, growing in such countless thousands. Acres of open hillside were yellow with it, sheeting the meadows, covering the rocks, lining the streams, everywhere. It seemed to take up most of the valley, between 10,000 and 12,000 feet. Professor Wright Smith informs me that it is probably a new variety of *P. serratifolia*, but personally, I think it has every claim to specific rank. In appearance, the two plants are quite different. They never grow together, and *P. serratifolia* is only found 2,000 feet higher up, where this variety is scarce. The second species had big leaves and small, gamboge flowers, which looked as though they would expand later, but never did. I put it down on sight as a 'Sikkimensis'—until I saw it in fruit; then I decided that it, too, must be a 'Candelabra.' These two sections have much in common—in foliage, in habit, their flowers usually whorled, and in their choice of situation; they are easily distinguished by their capsules, their seeds, and less certainly by their corollas. Here, however, was a baffling species with the Sikkimensis flower, the 'Candelabra' capsule, and foliage which might have belonged to either! It grows in wet ground by streams, if not actually in bogs, but is not a plant with a future, so to speak; and its name is *P. prenantha*. Another fine plant just in flower was so like *Meconopsis Baileyi* that at first I thought it must be that species (see *Gard. Chron.*, April 30, Fig. 148). Anyone who pictures *M. Baileyi* will have an almost exact picture of K.W. 6,862, which only differs from the prototype in a few technical details, and these do not affect its make-up. This *Meconopsis*

Another and evidently very large species of *Meconopsis* was sprouting, but did not flower till July. It had a crown of pinnatisect leaves

After climbing the last snow slope, we reached my new hut, at the junction of two snow-bound valleys. There were some herds' huts also, one of which my servants occupied. The altitude was exactly 11,000 feet, and it was clearly an excellent location, for steep and high as the mountains were, they could be climbed. I could go up either valley at will; and though there was a great quantity of snow, it was melting, and it was better to be too early for the flowers than too late. So I settled down in the hut for three weeks' exploration.

The valley was a little wider where the streams joined, floored with meadow and bushes; but the ground was boggy. I was rather surprised to find a good mauve form of *Primula Wardii* here, the first record of its occurrence in Burma, far west of its chief centre. Lining the bank of the stream, too, was a form of *P. sikkimensis*, with very fragrant milk-white flowers; but this, which recalled *P. microdonta* variety *alpicola*, of Tibet, was scarcely in flower.

The rest of the day was spent in putting my house in order, as I wanted to start exploration on the following day. The first necessity was a fire, not only on account of the cold—and at night the temperature in the middle of June sank to 40°—but still more on account of the prevailing dampness. Clothes, drying paper, everything when not in use had to be kept either shut up in a steel box, or on a rack over the fire, and extensive arrangements were made for drying paper, of which I had brought a large supply. This was a great improvement on a tent; and though the wind whistled through the wide cracks, which gaped between the logs, I suspended some waterproof covers and kept it at bay.

Next day I started up the snow-bound valley towards the Diphuk La. Success was immediate. A minute mauve or purple-flowered *Primula* of the 'Auriculata' section, scattered over the sodden, sloping lawns, recalled *P. Genestierana*, Handel Mazzetti (= *P. Doshongensis* of Tibet), and is therefore scarcely a garden plant, but it had more flowers in the spherical head than that species. Much more promising was a dwarf *Iris*, its purple-stained flowers almost flush with the ground, peeping through the snow. These flowers were certainly fragrant, and so I recorded them; but subsequent attempts to elicit some perfume always failed.

FIG. 191.—VIEW OF THE UPPER SEINGHKU VALLEY ON THE BURMA-TIBET FRONTIER AT THE END OF JUNE. 11,000 FEET ELEVATION. ABIES AND RHODODENDRONS ON THE SLOPES.

covered with long, silky, golden hairs, recalling *M. Wallichii*, though in other respects it was a very different plant, more like *M. discigera* in habit, and *M. robusta* in capsule.

I do not know why, unless the plants were too old, or too dry, or too wet, or it was the wrong time, or something else. The stem never elongated. There was no stem, but the tube

was long; the falls had neither crest nor beard, and the capsule opens only at the centre of the sutures. In late October, I found a few growing out of the ground.

On the great granite cliff which flanked the valley on the other side of the stream, I found a second, slightly larger, 'Auriculata' Primula, quite a dainty thing, with mops of mauve flowers; and saw, out of reach, shivering bunches of the glorious but obstinate *Isopyrum grandiflorum*. It seemed, however, fairly evident that the chief treasure-trove of the Seinghly lay amongst the *Rhododendrons*, actual and prospective. *F. Kingdon Ward.*

## NOTES FROM A WELSH GARDEN.

In spite of the cold spell that prevailed from just after Easter to the end of April, spring-flowering shrubs in general have fared very well. *Exochorda grandiflora* has seldom been better, and the more uncommon *E. Giraldii*, in an exposed position by the waterside, is carrying a fine head of its very large white blooms. The habit of this shrub appears to be considerably stiffer than that of the foregoing; it is a vigorous grower, and its racemes of seven or eight flowers are held upright at the tips of the branches. In a sheltered place in the woodland, *Camellia Donckelaeri* was, early in May, a striking object, its semi-double, gold-centred, crimson-scarlet blooms being very effective against the glossy, deep green foliage.

Few shrubs arouse more admiration at this season than *Pieris formosa*. Though the plant lost many of its blossom buds during the winter, the burnished vermillion of the bold new shoots and leaves makes such a wonderful display of unusual colour as to compensate for the absence of bloom. *Erica australis* is another member of the Ericaceae which is always effective, and this year the flowering sprays are exceedingly good. I have rarely had this excellent Heath injured by frost, notwithstanding the fact that it makes much of its new growth in winter and early spring. *E. mediterranea* var. *Brightness* is a distinctly beautiful form. Its blossoms are produced in long and ample trusses. The individual flowers are larger and of a rosier hue than those of the type, and they come a little later.

*Dendromecon rigidum* opened the first of its fragrant, golden yellow blooms earlier than usual, the branches not having been cut back. *Solanum crispum* was only a few days later. *Ceanothus rigidus* (on a west wall) is the earliest by several weeks of its genus, and its violet clusters never fail to excite admiration. The very stiff and straight growths of this species, together with the small, leathery leafage in a dark, glossy green, promise to make a first-rate support for *Mutisia decurrens*, and should make a pleasing setting for the gorgeous flowers of that noble Composite.

*Phillyrea latifolia* (syn. *P. media*), which has been here for many years without flowering or growing to more than four feet or so, has been full of blossom this spring, the white, fragrant flowers being crowded in axillary clusters. Near to this, in an open part of the woodland, is *Osmanthus Delavayi*, a singularly choice little shrub with waxen-white, deliciously-scented, tubular flowers.

Though not now considered among the choicer *Rhododendrons*, few of the dwarfer members of the genus grown here attract more admiration than that old North American species, *R. punctatum*, and its clear, pink flowers, in neat little trusses, are certainly very charming in the part shade of the woodland. Under similar conditions, the taller *R. yunnanense*, with blossoms of a much paler hue, is also delightful. The large-flowered, pure-white *R. ledifolium* and the rose-purple, double-flowered var. *plenum*, are very noteworthy objects in this section, but while both are perfectly hardy here they are rather liable to be touched by spring frosts, unless they have such protection as may be afforded by the branches of tall, deciduous trees.

*Gaultheria Veitchiana* is well furnished with its axillary racemes of pinky-white blooms, and *G. trichophylla*, choicest of the more lowly species, is promising a goodly crop of its in-

comparable blue berries. *Vaccinium corymbosum*, a tall, deciduous, North American species, is one of the best of its race, for it is not only good in spring, with its tender green foliage and abundant clusters of large, pinky-white blossoms, but the blue berries are distinctly effective, and the autumn coloration of the foliage extremely brilliant. This *Vaccinium* will, moreover, flourish in any average lime-free loam that is not excessively dry. *Phyllodoce empetrifolia* is worthy of more than passing mention, and one wonders why it is so seldom seen in gardens. It is a success in a cool, light loam, and comes into flower in spring, just as *Erica carnea* goes off; its bright reddish-crimson bells are singularly attractive. Not less easy is its ally, *Phyllothamnus erectus*, a dainty little shrub with terminal clusters of large, bell-shaped blossoms in a vivid rose. These two, with the pretty *Kalmia glauca*, make a trio of Ericaceous shrubs of the utmost charm and usefulness at this season.

Both *Shortia galacifolia* and *S. uniflora* blossomed unusually early this season, for when I returned from abroad at the end of April, the plants were carrying nothing but seed-heads. Another plant which was evidently rushed into blossom by the warm weather at Easter is *Meconopsis quintuplinervia*. There were spent flowers on this also by the date mentioned, but the Harebell Poppy has a longer season than *Shortia*, and there is still a good crop with more to follow of the lovely lavender-blue blossoms.

Very delightful in the cool, but light loam enjoyed by the above, is *Oxalis Acetosella rosea*, which has become quite naturalised, blending with the type species and other native herbage. Yet another very beautiful wildling is the pale blue form of *Anemone nemorosa*, often called the Welsh Anemone. In the woodland and by the waterside, *A. trifolia* has proved a splendid coloniser, making broad drifts of its pale green leafage, which is starred with the milk-white flowers for several weeks at this season.

Rising out of the bog are the eighteen-inch flowering stems of *Helonias bullata*, a Liliaceous plant, the starry flowers of which, in a pleasing pink, appear in a large, cone-shaped cluster at the ends of the stalks. Of the same tint is a colony of the pink form of *Primula pulverulenta*. These never fail to rivet the attention of visitors, who are also delighted with the Globe-flowers which are once more substantiating their claim as being amongst the most valuable of spring-flowering, waterside subjects. With the exception of *Trollius europaeus*, the earliest of the Globe-flowers to bloom here are invariably the hybrids of garden origin, the species generally being fully a month later.

The big, yellow spathes of *Lysichiton camtschatcense*—half-a-dozen on a single plant—make a conspicuous dash of colour at the edge of the stream over which the yard-long stems of *Caltha polypetala* are reaching. With these and other things which are left very much to fend for themselves, the purple flowers of *Cardamine macrophylla* are by no means to be despised. *Omphalodes cornifolia* (cappadocica) is abundantly naturalised in this part of the garden. There is no more useful plant than this for spring flowering by the waterside or in cool, woodland places, but I find that it is always best to afford the plant some slight natural protection from frost and wind, otherwise the delicate beauty of the flowers is apt to be marred. *A. T. Johnson, Ro Wen, Conway, North Wales.*

## SALES OF DISEASED PLANTS.

THE Sales of Diseased Plants Order 1927, which is dated the 22nd April, 1927, and which came into operation at the end of that month is a measure with which every gardener ought to become acquainted. This Order, which was passed under the powers given to the Minister of Agriculture by the Destructive Insects and Pests Acts of 1877 and 1907, provides that no one may sell or offer for sale, for planting, any plant which is attacked by certain insects or pests, or any plant which appears to have been attacked by certain other insects or pests.

Secondly, everyone who has had in his possession or under his charge any plants attacked by these insects or pests must give all the information he can as to the person in whose possession they have been, if required to do so by the Minister of Agriculture.

Thirdly, the Order gives Inspectors of the Ministry of Agriculture power to enter premises where plants are offered for sale, for the purpose of examining them.

In order to prevent the sale or movement of diseased plants, anyone who has possession of them must take steps to prevent their sale or movement, except under the authority of an Inspector.

The Order further gives an Inspector power at any time, by notice served on the person who has such plants in his possession, to require him to take one of the following courses:

- (1) To destroy the whole or any part of the plant by fire or such other suitable method as may be specified in the notice;
- (2) To disinfect the plant to the satisfaction of the inspector; and
- (3) To take such other steps as the Inspector may consider necessary to prevent the spread of disease.

The notice may also state a time within which it is to be complied with.

As regards the pests to which the Order refers, if the plant is actually attacked they are, in the case of trees: Fruit Tree Cankers, American Gooseberry Mildew, Silver Leaf, Black Currant Mite, Woolly Aphis, all Scale Insects, Brown Tail Moth, *Rhododendron* Bug; and, for vegetables and roots, Powdery or Corky Scab of Potatoes, while if the plant merely shows evidence of having been attacked by Apple Capsid it will come within the provisions of the Order.

The penalty for selling or offering for sale any plant attacked by these insects or pests, or for failing to take the steps required in a notice given by an Inspector, or for impeding an Inspector is a fine of £10.

The Act defines a "plant" so as to include tree and shrub, and the fruit, seeds, tubers, bulbs, layers, cuttings or other parts of a plant. *H. S.*

## NOTICE OF BOOKS.

### Frost and Light.

DR. KINZEL of the Bavarian Landesanstalt für Pflanzenbau und Pflanzenschutz (Munich, Liebigstr. 25) has been busy for many years with most careful experiments on the conditions of seed germination. He has already published three volumes of detailed reports, and has followed the slowly germinating seeds for years. Many of his experiments have been made in Petri dishes in dark cupboards indoors, but he has also exposed other seeds to the influence of frost and light before attempting germination.

He reports that particularly with alpine plants exposure to frost helps germination. In the present volume\* results are summarized thus:

<i>Gentiana cruciata</i>	L.	---	---	---	43 78
O.B. Landsberg	LF <sub>1</sub>	18.0	---	---	96 ●
a.L. 8.9.21	DF <sub>1</sub>	---	---	---	1 87 94

from which we understand that a sample of seed of *Gentiana cruciata* was gathered at Landsberg on the Lech, in Upper Bavaria, on September 8, 1921. Three samples of seeds were sown on September 18, one in light, one in light with exposure to frost, and one in the dark with exposure to frost. No germination was observed during the last four months of the year, and none in January. Of the first sample, 43 per cent. had germinated in February, 78 per cent. in March, of the second sample 96 per cent. in March, and all in April; of the third sample only one per cent. in March, but 87 per cent. in April and 94 per cent. in May. The table is continued into later years showing the germination of the first sample as complete

# FERNS AND FERN CULTURE

By J. BIRKENHEAD.

Revised by F. Parsons.

**PRICE 1/4 POST FREE**

Ferns ought to play a much larger rôle than they do in the English garden. There are so many places where, in consequence of shade cast by tall trees or high walls, flowers needing sunshine will not thrive, and where Ferns, on the contrary, would luxuriate, given only sufficient moisture.

Ferns have a grace and dignity all their own, and can redeem by their beauty what would otherwise be a bare and unattractive corner of the garden. Those wishing to cultivate them cannot do better than purchase the little book whose title appears above.

*It can be obtained from :*

**THE GARDENERS' CHRONICLE LTD., 5, TAVISTOCK STREET, LONDON, W.C.2.**

in the third March, and that of the third sample as complete in the second April.

So long as we are content to try only those seeds that will certainly grow, like Mustard and Cress, we shall have little use for Dr. Kinzel's tables, but the ample lists of English seedsmen will extend the list of species on which we may venture. However, with a more adventurous list of desiderata we may value the hint to expose to light at 20°C, *Anemone ranunculoides*, *Erica carnea* and *Iris Pseudacorus*; to dark and warmth, *Delphinium elatum*, *Galanthus nivalis* and *Gladiolus communis*; to light and frost, various species of *Gentiana*, *Primula* and *Saxifraga*; to dark and frost, *Trollius europaeus*; to dark and mild frost, *Lilium Martagon*; to light and mild frost, *Primula rosea* and *P. imperialis*. Of *Gentiana ciliata* it is reported that some 5,000 seeds remained fresh but ungerminated for twelve years; probably special earth containing definite fungi or nutritive material is necessary.

These laboratory results should be compared with gardening experience, such as that of M. Henri Correvon of Chêne-Bourg, near Geneva, published by him in *Les Plantes des Montagnes et des Rochers* (Paris, Doin et Fils, 8 Place de l'Odéon), in which he classifies alpine plants under some nine different treatments. We may now turn with renewed courage to some of the continental seedsmen's lists, such as Correvon's *Liste des Graines*, with some seventy *Gentians* and over one-hundred-and-fifty *Primulas*, or Haage and Schmidt's somewhat more modest list of *Blumen-Samen-Stauden* (Flower seeds—herbaceous). Messrs. Barr and Sons also offer a list of *Gentians* and *Primulas* a little longer than is found in most English catalogues.

Dr. Kinzel's books which have cost so much labour, should go only to those who can appreciate them. They may be specially commended to seed-testing stations and to those who are trying to raise alpine plants from seeds or who are receiving new and rare flower seeds from distant lands.

If Dr. Kinzel is right about the effects of light and frost in laboratory experiments, his results ought to be checked under gardening conditions. This may involve some amendment of the cultural directions printed on the packets in which seeds are sold (e.g., "sow in November"), and some satisfaction to the complaints of amateurs that seeds from their local seedsmen do not grow.

There remain some further questions which should go back to the laboratory:—Why do light, frost or certain fungi seem necessary for germination? Will any sort of light do equally well? Is there any advantage in ultra-violet light? Should seeds be protected by something which stops or which transmits ultra-violet rays, i.e., by vita-glass, or windowlite, or fused quartz? Or has the ancient practice of covering seeds with white quartz sand any merit for transmitting ultra-violet rays. Is the blackness of some seeds coats (*Aquilegia* and *Trollius*) useful for absorbing light, or for stopping light from penetrating the seed?

How does frost work on seeds? Is it by concentrating the cell contents into still more complex molecules, which, when afterwards dissolved, would have a still higher osmotic pressure? Or does frost disintegrate seed coatings? Or is actual frost not really necessary but only a wide oscillation between maximum and minimum temperatures? Does water enter the micropyle in the seed as it enters the narrow tube when a thermometer is filled by alternately heating and cooling the bulb? Is liquid water ever necessary to germinating seeds, or do they all always germinate in an appropriate pressure of water vapour?

Why are special soils necessary for certain seeds (? *Gentiana ciliata*). Is it on account of fungi which attack the seed coatings, or on account of some symbiosis of seedling and fungus, or on account of some nutritive (? organic) chemical produced by the fungus? Is it possible to add any chemical (sugar, glucose) to the soil which might stimulate the life of the fungus, or any other chemical, perhaps an organic acid (? tartrate), such as might be produced by the fungus, which would directly stimulate the life of the seedling? Does the visible splitting of a Peach stone when the kernel germinates throw any light on what happens in much smaller seeds? *Hugh Richardson*.

## VEGETABLE GARDEN.

### BRUSSELS SPROUTS.

To obtain the best results with Brussels Sprouts it is necessary to grow the plants in deeply-worked, moderately rich, firm soil, which is not deficient in lime. A good strain and ample room for the development of the plants are other important details.

As Brussels Sprouts require a long season of growth, it is important to plant them in their final quarters during May or in early June for early supplies, and the later ones so soon as they are large enough. Firm planting is essential. Where the space can be afforded, three feet apart each way is not too much for the large-growing varieties, and two-and-a-half feet for the smaller types.

If intercropping is practised nothing should be attempted that will interfere with the main-crop; it is not good policy to grow Brussels Sprouts as an intercrop with Potatoes.

Should the weather prove dry at the time of planting, puddle the plants rather than delay the operation too long by waiting for more favourable conditions. When well established, the plants will benefit by a little soil being drawn up to their stems. The soil should be hoed on frequent occasions, and a sharp watch maintained for insect pests. Constant attention in the removal of decaying leaves during autumn and winter is advised to allow the air to circulate freely amongst the plants. The removal of the head should not take place until all the sprouts are picked; the latter should be gathered from the bottom upwards as they become fit. If desirable, plants from one sowing will continue in bearing over a considerable period.

Choice of variety will depend on the purpose for which the crop is required. For private establishments, small sprouts are favoured, and a good variety of this type is Filbert, which was exhibited by Mr. Edwin Beckett at one of the R.H.S. meetings recently. Market growers prefer sprouts of large size, such as Covent Garden Favourite and Evesham.

Varieties may be roughly divided into dwarf and tall forms, respectively. Good representatives of the former are Dwarf Gem, Half Long Paris and One and All. The last-named is a German variety which produces small, firm sprouts, and may be highly recommended for private gardens. An Award of Merit was given to this variety during a trial of Sprouts at Wisley in 1923.

Of the taller forms, Aigburth, Darlington and Holborn Exhibition produce good, firm sprouts of a useful size. *J. Wilson, Wisley*.

## CABBAGE ROOT FLY.

### (CHORTOPHILA BRASSICAE, BOUCHE.)

This pest is making its appearance in most parts of the country. If the soil around the stems of Cabbages is examined carefully the eggs of the fly will be found. The eggs are small and white but may be seen quite easily with the naked eye.

In this country we get two generations of the pest each year. In hot, dry seasons we occasionally get a third generation, but this happens so spasmodically that it is not considered further in this note. The first generation emerges from the winter puparium state about the second or third week in May. After pairing, the females deposit their eggs in, or on the soil close to the stems of Cabbages, etc. The flies are very fond of creeping down into the soil where the stem of the host plant has been swaying about in the wind and formed a hole. Eggs from this first generation reach the maggot stage about the end of May or early June.

The second generation appears about five weeks after the first, but instead of forming a third generation the pupae from this generation usually remain until the following spring. There is, of course, much overlapping between the

generations, which accounts for the fact that at certain periods it is possible to find adults, eggs and fully-fed maggots. In spite of this overlapping the two main attacks centre themselves fairly definitely at the two periods stated above.

It appears to me that in the control of this pest we often overlook one important point, namely, the attack of the first generation. This attack usually takes place on autumn-sown Cabbage, and is often totally unnoticed. On the other hand, the second generation attacks newly-planted out summer and autumn greens; this attack is rarely missed and much is done to ward off its evil. Each year, with me, the first flies are to be found on the wing about the 14th to 21st of May; last year they were seen as early as the last week in April. Eggs are always laid on autumn-sown Cabbages, which at that time are established plants and have a fairly big root-system. Such plants can carry a fair crop of maggots without showing very much sign of their presence above ground. Because this first attack does not advertise itself very much by killing off numbers of plants it is often overlooked altogether.

The arrival of the second generation is quite another matter; it occurs about the time of planting out Cauliflowers, summer Cabbages, Brussels Sprouts, Broccoli, etc. Such plants are not established plants, even if they have become settled in their new quarters; they have very small root-systems and can carry very few maggots without showing signs of distress. In a very short while the pest eats away the whole of the root-system of the young Brassicas, and down the plants go. This is the attack we are all so familiar with, and most of us try various methods of control. Methods of control are often adopted too late in the season. If the grower could reduce the attack of the first generation on the established Cabbage plants he would have an easier task with the second generation. It may be argued that the size of the root-system of the attacked plants has nothing to do with the fact that the first attack often passes unnoticed and that a better reason is that the second generation has so increased in numbers that it is able to do much more damage. This increase may be true, but I have lifted Cabbages just about ready for cutting during the attack of the first generation and found twenty to thirty maggots present, and the plants appeared quite normal above ground. If these twenty or thirty maggots had been present on a newly-planted-out Cauliflower it would have been a different matter.

Much has been written on the control of Cabbage-root-fly, and the methods advocated fall more or less into three groups:—(1) Prevention of egg-laying; (2) Killing the maggots; (3) Winter treatment of the soil to kill the puparium stage.

(1) Prevention of egg-laying.—Many things have been recommended to deter the Cabbage-root-fly from laying its eggs near the host plant. The main idea always is to make the surroundings distasteful to the fly. Tarred felt discs, paraffin oil, carbolic acid, creosote and many other things have been used with a fair amount of success. I have tried most of these materials, but have had the greatest success with creosote. I advocate the method recommended by Smith,\* of Manchester University, namely, quarter-ounce creosote mixed with twelve ounces of precipitated chalk. In practice I have found that one ounce of creosote added to three pounds of chalk and thoroughly mixed together is a useful unit. I find, too, that the preparation is best mixed twenty-four hours before it is used. I do not sow the mixture over the whole of the soil but place about half-an-ounce around the collar of each plant. The application should be repeated at intervals of ten to fourteen days during the dangerous period. In the past sand has been very largely used as a spreader for various chemicals to deter Cabbage-root-flies from egg-laying. Smith recommends that sand

\* The Control of Maggots attacking the Roots of Vegetables, *Journal of the Ministry of Agriculture*. Vol. 29, No. 3, page 280, by Kenneth M. Smith, A.R.C.S.

should not be used as a spreader for the creosote, as it does not absorb the chemical.

(2) Killing the Maggots.—This is a much more difficult matter than the prevention of egg-laying. Again, many things have been recommended from time to time, e.g., sulphate of ammonia, nitrate of soda, common salt, liquid ammonia, corrosive sublimate, etc. Each of the first four mentioned I have tried from time to time. I find that they will all kill very young maggots but that they are useless for the destruction of older ones. I have also used crude naphthaline with even better results. It should, however, be pointed out that naphthaline must be applied before the maggots are very far advanced, because if it is not used until all the roots have been eaten, although the naphthaline may kill the maggots, it does not save the plants. Apply the naphthaline by first mixing it with a spreader; my mixture is naphthaline, one part; dry garden soil, three parts; applied at the rate of one ounce per plant. Thus each plant gets one-fourth of an ounce of naphthaline. I find that the naphthaline mixture is useless in dry weather: it must either be applied in showery weather, or else the plants must be watered after the application. This year I am hoping to use both corrosive sublimate and also calcium cyanide to test their usefulness.

(3) Winter Treatment of the Soil.—All soil that has borne an infested crop should be treated with a reliable soil insecticide. Crude naphthaline, applied at the rate of two ounces per square yard, gives very good results. When using a soil insecticide for this purpose it is best to delay the application as late in the spring as is practical. The naphthaline should be spread evenly on the top of the soil and well forked in. I have not found that the naphthaline retards the next crop to any marked extent.

In any attempt to control Cabbage-root-fly it is important to start with the first generation. We must look for, and attack, the generation that carries out its life history on the autumn-sown Cabbage and not wait until the second generation comes later. *Somerset.*

## HOME CORRESPONDENCE.

**The Problem of Bolting.**—I read the remarks of A. B. B. on this subject (p. 320) with interest, but found in it very little elucidation of the problem. I am very strongly of opinion that the main causes of bolting are to be found in cultural errors. Last year I sowed White Milan Turnips twice, fairly early, and on ground not manured the previous season. The first sowing, made on good, deeply cultivated soil, produced a crop, only a few of the plants bolting after the Turnips were formed. The plants of the second sowing, on ground not so well cultivated, proceeded directly from seedling to flowering stage, without showing a sign of bulbing. I have grown Globe Beetroots on ground unmanured as well as manured, and have had a small percentage bolt in both cases. Last winter I came across a whole row of white Celery which had bolted, and on enquiring, I learned that the seedlings had not been planted out in the trenches at the time they were ready, but had had to stand in frames for some time. Early sowing of Cabbage is considered to promote bolting, but of that I am not convinced. Thorough cultivation of the ground, according to the needs of the various subjects, and the growing of crops without any undue check, from seedling stage to maturity, will, I believe, practically solve this problem. Of course, there are checks provided by the weather which it is impossible to guard against, and these, no doubt, play their part. It would be interesting to have the views of others. *C. Fletcher, The Gardens, Stowe School, Buckingham.*

**Damage by Frost at Aldenham**—I observe that in your issue of May 21, Sir Herbert Maxwell states that the injury inflicted on his plants by spring frosts has not been so bad as it was last year, when they occurred later in May. With us, at Aldenham, I am sorry to say it has been incomparably greater; indeed,

I have no hesitation in stating that the frost of 17° which occurred on May 1 was the worst spring frost that I have ever known; it followed on two other very severe ones, 15° and 13°, respectively, and all three were subsequent to the midsummer temperature at Easter, which brought numerous plants into full leaf. The devastation produced was really appalling, not only the foliage being burnt black, but in many cases two-year-old wood being killed; indeed, it is too early yet to say how much of the branches of trees and shrubs has been ruined. Absolutely hardy plants have suffered as much as those usually regarded as tender; the common Hazel, for instance, common Ash, and subjects capable of contending against winter conditions in Massachusetts, like *Cercidiphyllum japonicum*, have all been seriously disfigured, even if not crippled. Many Maples have been desperately injured, and two well-established trees of *Acer japonicum*, about fifteen feet high, have, I fear, been killed outright. A large shrub of *Indigofera* which was a sheet of rose-red flowers last summer, is killed to ground level, as also is *Polygonum vaccinifolium*, and nearly every other species of that family. Although last winter was a mild one with only two really cold nights, yet one frost of 21° occurred before winter ought to have begun, and the other 17° after it ought to have ended; the two combined have done untold damage. Evergreen subjects have in almost every case escaped, even some, such as *Cunninghamia lanceolata*, which I should have expected to succumb altogether, and, much to my surprise, Tree Paeonies also have been untouched and have flowered as well as ever. The Rose garden is a shocking sight, and all hope of June flowering is gone; some plants are killed outright and many more maimed. Perhaps the two varieties which have suffered most are Lady Hillingdon and Mrs. Wemyss Quin. Deciduous Barberries of Chinese origin have also been victimised, and many are so badly seared that they have had to be cut back to within a few inches of the ground. I shudder to think what the slaughter would have been if the country had been wet instead of dry when this cruel visitation took place. Even our Nettles have not got off scathless, but where there is so much to grieve over I bear this with remarkable equanimity. I must not omit to mention that every *Hydrangea*, *Diervilla*, *Philadelphus* and *Deutzia* shows woeful evidence of the untimely cold to which they have been subjected. I will leave others to tell in detail of what has happened to their fruit, but I will just add that all Plums, Damsons and Strawberries are wiped out, while Pears, Apples and Gooseberries will at best be only a half-crop. *Vicary Gibbs, Aldenham House.*

**Deterioration of Strawberry Plants**—I can endorse all that Mr. Hartless has written, on p. 358, with reference to the deterioration of the Strawberry during recent years. It has been very marked during the past few years in these gardens, and this year the indications are that it will be even more apparent than ever, and it is bitterly disappointing when special efforts have been made to overcome it. Last season, when gathering the fruits, I rooted up all plants that showed any sign of deterioration, both as regards fruit and foliage, and I followed this up with a further weeding out before layering the runners for this season's beds. I examined every runner before planting them in the autumn and threw out scores of plants the men brought me which they themselves would have planted in my absence, and now, after all this, I have the most miserable, newly-planted bed of Strawberries I have ever seen here. I may add that during the past fourteen years I have several times renewed the stock by purchasing runners from the best sources. I have tried most of the varieties in commerce, and The Duke, Royal Sovereign and Bedfordshire Champion having proved most meritorious, constitute our stock. In an adjoining garden where a new bed was made last year with new stock from a firm which specialises in Strawberries, the same state of affairs exists. It will be helpful if readers will name varieties that are resistant, and I hope the Ministry of Agriculture's scheme of certification may lead to better results in the future. *T. A. Summerfield, Alderley Park Gardens, Chelford.*

## SOCIETIES.

### CHELSEA SHOW.

(Concluded from page 384).

#### Rhododendrons and Azaleas.

THE various collections of Rhododendrons and Azaleas, both in the tents and in the open, added masses of brilliant, glowing colour which amply provided the needed brightness. In one of their groups, Messrs. WATERER, SONS AND CRISP had a splendid plant of Corona bearing many trusses of rich, rosy coral flowers. In the companion group the centre was filled with excellent bushes of Pink Pearl. Chief amongst their other good varieties were Joseph Whitworth, purple and maroon; Diphole Pink, Gomer Waterer, white flushed with lilac; Monstrous, a gigantic pink truss; Doncaster, deep red; Sappho and Baroness Henry Schröder, large trusses of white flowers heavily spotted with crimson-maroon; Elsa Crisp, deep pink; Starfish, bright pink, and Bagshot Ruby.

In association with their attractive group of Lilliums and Irises, Messrs. R. W. WALLACE AND CO. had a showy group of excellent Rhododendrons. There were well-flowered bushes of Britannia, Pink Pearl, White Pearl, Countess of Athlone, blush; Corona, rosy coral; Betty Wormald, pink with a white centre; Doncaster, Duchess of Edinburgh, edged with rich pink; Corry Koster, blush with undulated margins; Cynthia, deep pink, and Alice, deep blush.

A charmingly arranged group of Rhododendrons was displayed by Mr. WALTER C. SLOCOCK. The bushes were set in a mossy ground with blue Scillas and Blechnum spicant. The principal Rhododendrons were Lady de Rothschild, Royal Purple, Goldsworth Yellow, Purple Splendour, Pink Pearl and Lady Grey Egerton.

Fifty of the older varieties were displayed by Mr. T. LEWIS, who finds them to be often more generally satisfactory than some of the more recent sorts. He grouped very good bushes of Rhododendrons Doncaster, G. A. Sims, Bagshot Ruby, John Waterer, Sir Robert Peel, Miss E. C. Stirling and Lady Grey Egerton, and also included several good specimens of *Kalmia latifolia*. In the tents, groups of Rhododendrons were also arranged by Messrs. M. KOSTER AND SONS and by Messrs. L. J. ENTZ AND CO., and the latter also showed Azaleas.

In the tents, Messrs. R. AND G. CUTHBERT had a magnificent corner group of deciduous Azaleas, which yielded glowing masses of colour. There were tall standards of double *Azalea rustica* varieties, such as Cornelia, Ribiera and Phoebe. Many excellent mollis, occidentalis and Ghent varieties, as well as hybrids between A. mollis and A. sinensis were also represented by profusely flowered bushes. Messrs. M. KOSTER AND SONS arranged beds of hybrid Rhododendrons and Azaleas of merit at the opposite side of the tent.

#### Trees and Shrubs.

While the exhibits of hardy Rhododendrons and Azaleas provided masses of brilliant colouring, the collections of general hardy trees and shrubs were of considerable interest and often arranged with great skill and taste. Messrs. HILLIER AND SONS had two valuable groups in which the dominant items were Bamboos, Japanese Cherries, Brooms and Hydrangeas. In addition to a good selection of these they included Wistarias, Viburnum Carlesii, Rosa Hugonis, Xanthoceras sorbifolia, Fuchsia parviflora, Actinidia Kolomikta, which has leaves half green and half rose-coloured; several large flowers of *Paulownia imperialis* from a tree over twenty feet in height, growing in their nursery at Winchester; and a fruiting plant of *Musa japonica*, syn. M. Basjoo.

A considerable corner space was well filled by Messrs. J. CHEAL AND SONS with many Rhododendrons and Azaleas, Japanese Maples of bright colouring; standard Brooms, Ceanothuses, *Kalmia latifolia*, Wistarias, Brooms, Berberises and several varieties of *Philadelphus*. Messrs. DANIELS BROS. had an attractive group of various Crataegus, Brooms and Roses rising above a groundwork of *Hydrangea paniculata*.

grandiflora, and bordered with a good strain of *Aquilegia hybrids*.

A very effective arrangement of Brooms and Japanese Maples was made by Mr. R. C. NOTCUTT. The chief *Cytisus* were *Dallimorei*, *kewensis*, Cornish Cream, pallida, scoparius Dragon Fly, sessiflorus and Donand Seedling. In another place Mr. NOTCUTT had a group of miscellaneous shrubs, including *Tamarix tetrandra*, various shrubby *Ceanothuses*, *Viburnum macrocephalum*, *Corkia Cotoneaster* and deciduous *Azaleas*.

Several very large, shapely and well-coloured Japanese Maples were arranged by Mr. J. C. ALLEGROVE, with *Rosa Hugonis*, *Cytisus Dallimorei*, *C. pallida* and a selection of *Lilacs*. Two groups exhibited by Mr. G. REUTHE contained many interesting shrubs. The chief were *Tricuspidaria Hookeriana*, *Embothrium coccineum*, *Cestrum coccineum*, *Mitraria coccinea*, *Philesia buxifolia*, *Telopea speciosissima*, *Eucryphia Billardieri*, a beautiful species illustrated in *The Gardeners' Chronicle* thirty-five years ago, but now a very rare shrub; *Davidia involucrata*, and many *Rhododendrons*, including the rich, orange-coloured *R. Griersonianum*.

On the staging, Messrs. W. AND J. BROWN had a good selection of *Lilacs*, which included President Carnot, Madame Lemoine, Chas. Joly and Michael Buchner of the double-flowered varieties, and such good singles as Congo, Souvenir de Louis Spaeth and Marie Legraye. With the *Lilacs* they displayed well-flowered plants of *Salvia Harbinger* and *Heliotrope Lord Roberts*. Mr. CHARLES TURNER also had a good collection of *Lilacs*, including most of the varieties named above, and Charles Sargent and Arthur W. Paul. They also showed branches of *Cercis Siliquastrum*, *Tamarix africana*, *Ceanothus floribunda* and *C. divaricatus*.

The YOKOHAMA NURSERY Co. staged many very fascinating dwarfed Japanese trees of perfect form. They had very old examples of *Cupressus obtusa*, many *Pinuses*, *Larches*, *Spruces*, *Junipers*, *Maples* and *Azaleas*, all of great age, but very healthy. In their collection of new *Cytisuses*, Messrs. C. WATSON AND SONS included the variety Lord Lambourne, which received an Award of Merit, an unnamed seedling of beautiful rose and pale golden colouring, and several other desirable sorts. Mr. G. G. WHITELEGG displayed a white variety of *Wistaria multijuga* with *Rhododendrons* and deciduous *Azaleas*, and bordered their exhibit with various alpine.

In their groups of shrubs, Messrs. R. GILL AND SON gave the central place to a large stand of *Embothrium coccineum*. They also showed *Tricuspidaria Hookeriana*, *Drimys Winteri*, *Abutilon vitifolium*, *Calceolaria violacea*, *Magnolia Watsonii*, *Pittosporum crassifolium*, *Rhododendron Griersonianum*, *R. decorum* and *R. Dalhousiae*.

The only exhibit of *Clematis* was a very handsome circular group arranged by Messrs. G. JACKMAN AND SONS. This included splendid plants of the purple Jackmanii, The Bride, W. E. Gladstone, lavender, The President, rich purple; Lord Londesborough, pale lavender; Lord Neville, deep lavender; Jackmanii rubra, of rich colouring; Gloire de St. Julien, bluish lavender; Mrs. Spenser Castle, double-flowered lavender; Beauty of Worcester, double lilac; and the popular Nellie Moser.

The several large groups of trees and shrubs in the open received a deal of admiration during the first two days of the show, and even during the rain on Friday they received attention from lovers of trees and shrubs. Messrs. WATERER, SONS AND CRISP had many large *Rhododendrons*, *Enkianthus campanulatus*, *Berberis verruculosa*, Brooms, *Maples*, *Azaleas* and a good selection of *Conifers*. Mr. H. HEMSLEY grouped *Rhododendrons* and *Azaleas* with Brooms, *Grevillea rosmarinifolia*, *Cornus Mas variegata*, *Tricuspidaria Hookeriana*, *Fabiana imbricata*, *Senecio Grayi* and other desirable shrubs.

A good selection of ornamental vines, arranged by Messrs. L. R. RUSSELL, LTD., included *Vitis Henryana*, *V. repens* and *V. Coignetiae*. They also showed *Ceanothus floribunda*, *C. divaricatus*, *C. papillosus*, many Japanese *Maples*, Brooms and *Azaleas*. Messrs. HILLIER

AND SONS and Messrs. FLETCHER BROS. had collections of shapely *Conifers*, and the latter also included various Brooms, *Maples* and *Rhododendrons*.

Many interesting *Conifers*, including the new *Cupressus Lawsoniana erecta aurea* and *Cryptomeria japonica alba spica* were arranged by Messrs. HOLLAMBYS, LTD., who also displayed *Osmanthus ilicifolius variegatus* and some well coloured Japanese *Maples*.

A large and very complete collection of Japanese *Maples* was arranged by Messrs. W. FROMOW AND SONS. This included *Acer palmatum atropurpureum* and *A. p. sanguineum*, of brilliant colour; *A. p. dissectum palmatifidum*, *A. p. d. variegatum*, *A. p. d. atropurpureum*, and *A. p. d. ornatum*, with very finely divided foliage, and the beautiful *Acer palmatum roseo-marginatum*.

Topiary specimens were extensively shown along Monument Road. Messrs. WM. CUTBUSH AND SON, Messrs. HARRODS and Mr. J. KLINKERT were the exhibitors. Box was the shrub used the most, but there were also good examples in green Yew, while the first-named exhibitor had many specimens in Golden Yew. Messrs.

chief varieties were Fascination, double blush Achievement, The Doctor, Emile Zola, Ballet Girl, Mauve Beauty and a variety of *F. fulgens* named Thalia. Mr. R. J. CASE had good Zonal, *Pelargoniums*. His principal varieties were New Life, an uncommon double with small pale pink and orange-coloured petals; President, Baillet, semi-double orange; Marjorie Slade, bright crimson double; and Chavarri Hermarros, a vivid scarlet double variety. Mr. J. C. BECK had a small collection of his perpetual-flowering *Carnation* Mrs. A. A. Vlasta, a robust variety, which has fragrant, rosy-purple flowers edged with silvery white.

In association with their interesting collection of greenhouse plants, Messrs. STUART LOW AND CO., had a handsome collection of *Carnations*. The chief varieties were Sir Philip Sassoon, Sheila Greer, Betty Loo and White Pearl. Adjoining the *Carnations* they showed a good selection of *Hippeastrums* and various Australian plants, including some especially well-flowered specimens of the Bottle Brush Tree, *Callistemon salignus*. There were also good examples of *Aotus gracillima* and *Leptospermums*.

FIG. 192.—CHELSEA SHOW: MR. PHILIP LADD'S EXHIBIT OF HYDRANGEAS

(see p. 378).

ROBERT GREEN, LTD., had a very large collection of Bay trees.

#### Miscellaneous.

The large, circular group of Dahlias in pots, so well arranged by Messrs. CARTER PAGE AND CO., received a deal of attention from lovers of this autumn flower. The plants were well-flowered and represented most sections, though the Decorative, Miniature Paeony-flowered and Cactus varieties were the most prominent. Messrs. J. CHEAL AND SONS had a good selection of cut flowers of the different types, and Messrs. J. FORBES, LTD., showed dwarf, floriferous plants of *Dahlia Coltness Gem* with their *Pelargoniums* and *Violas*.

Messrs. TOOGOOD AND SONS, LTD., set up a very attractive collection of greenhouse plants which included *Clarkia Salmon Queen* in quantity, many Dutch *Iris* in such varieties as White Excelsior, The First, Rembrandt and Van Everdrugen. These were flanked with *Schizanthuses* of a good strain, while *Cinerarias*, *Nemesias*, *Mignonette*, *Palms* and *Ferns* all helped to make an effective group.

A good collection of profusely-flowered *Fuchsias*, growing in relatively small pots, was arranged by the CASTLE NURSERIES. The

#### Science and Art.

We were pleased to note that the Science Tent, which was placed next to the Orchids, was much more popular with the visitors than formerly was the case. The R.H.S. and the various establishments which had exhibits were especially fortunate in their choice of representatives, and the visitors found at all times, keen men, ready and willing, and what is even more important, capable of imparting valuable information concerning the exhibits under their charge.

The most extensive exhibits were from Wisley, and these were of considerable scientific and practical value. An excellent range of photographs, supplemented by fruiting Plum trees, fully illustrated the many aspects of pollination of fruits, and impressed on the public the fact that many varieties are self-sterile, and that cross fertilisation is essential to the production of good crops of fruit. The more general fungous diseases were illustrated and valuable suggestions were offered for their prevention and cure. There were also diagrams and mounted specimens of the more common biting and sucking insects which bother the gardener, and here again the best remedial measures were indicated. The diseases of

flowering plants which were represented included the Aster Wilt, Carnation Stem Rot and the "New Mildew Disease" of Sweet Peas which was dealt with so well by Mr. W. J. Dowson in the R.H.S. *Journal* of July, 1924.

The ROTHAMSTEAD EXPERIMENTAL STATION had exhibits illustrating the make-up of the soil in its physical, chemical and biological aspects. This exhibit amply repaid the cultivator for any time spent in studying the diagrams so well set out, for he could learn the intimate connection between the physical, chemical, bacterial and biological characters of the soil. Of great value also was the apparatus for determining the amounts of sand, silt and clay in the soil, and humus, and its origin. The importance of a knowledge of the fungi, algae and insects of the soil was also well illustrated, and this included cultures of the useful fungi which cause the decay of plant remains, transforming them into valuable soil constituents, while, on the other hand, the harmful fungi cause diseases. The soil insects, ranging in size from the easily seen millipedes and centipedes to microscopic insects were dealt with equally well, and these were divided into three classes:

Veitchiana, C. Gouletii, C. Makoyana and C. Bachemiana.

A great many photographs from the ROYAL BOTANIC GARDEN, EDINBURGH, showed several methods of vegetative propagation. These illustrated stem-cuttings of many Gymnosperms, Monocotyledons and Dicotyledons, root-cuttings of Pelargoniums, Acanthus, Prunus, Aralia, Rubus, Araucaria, with many other genera, and there were also illustrations of success with leaf-cuttings of different plants.

The Art Tent, set at right angles to the Orchid Tent, contained many paintings of garden scenes and floral studies from many well-known painters of these subjects, and there were also selections of garden plants.

#### Garden Sundries.

In addition to the usual array of garden sundries in the Avenue this year there were many along the far side of The Lawn. As usual, these exhibits were very comprehensive and included a great variety of chemical aids to successful cultivation, as well as all possible tools and appliances. That the present-day

Except under rare conditions, a hot-water boiler is a necessary adjunct to the glasshouse, and the various exhibits were placed conveniently near so that the visitor had no difficulty in making a selection. Messrs. C. P. KINNEIL AND Co. had boilers of all sizes, from the giants required by the large market grower to the small boiler for the amateur's greenhouse, and several were partly set in brickwork, making the exhibit of particular value.

The THAMES BANK IRON Co. also showed a useful selection of greenhouse boilers.

Lawn-mowers of all sorts, from the smallest hand size, through pony and horse, to the most powerful motor-driven machine, and all of good quality, were to be seen in the Main Avenue. The chief exhibitors were Messrs. T. GREEN AND SON, who also had garden rollers; Messrs. THOS. GUNN, LTD., who, in addition to various mowers, had a wide selection of garden tools; The J.P. SUPER LAWN-MOWERS, LTD., showed their easy running types; Messrs. A. SHANKS AND SON, displayed their well-known patterns and rollers; Messrs. S. CONDRUP, LTD., included sprayers and syringes in their exhibit; Messrs. DENNIS BROS., LTD.; the GODIVA ENGINEERING Co.; Messrs. LLOYDS AND Co., also had a practical machine for collecting fallen leaves on lawns; Messrs. C. H. PUGH LTD.; Messrs. RANSOMES, SIMS AND JEFFERIES, who showed a wide range of patterns; Messrs. JOHN SHAW AND SONS; the TANGENT TOOL Co.; and Messrs. E. J. WOODMAN AND SONS, who also showed fertilizers.

Insecticides, fungicides and sprayers were frequently to be seen on the same stand, though some exhibitors confined themselves to the insecticides and fungicides. Messrs. ABOL, LTD., made a great show with their non-poisonous insecticide, White-fly Compound, patent syringes and special manures. The ACME CHEMICAL Co. showed their powder weed-killer, Quassia-Tobacco insecticide and various manures. Messrs. COOPER, McDUGALL AND ROBERTSON had a wide range of their specialties, including tree-banding materials and lawn sand.

Messrs. G. H. RICHARDS, LTD., who recently have acquired the Stonehouse specialties and Kamforite pest destroyer from Messrs. Henaman Bros., showed these preparations with a great many of their well-known insecticides, fungicides, fertilisers, garden tools and tying materials. The ECLIPSE SPRAYING Co., the F.N.P. MANUFACTURING Co., the FOUR OAKS SPRAYING MACHINE Co., who had power as well as knapsack machines; Messrs. HOULDER HARRIDEN, LTD., and Messrs. MARTINEAU AND SMITH, who had good pattern sprayers also contributed to this section.

Messrs. ADCO LTD. had an attractive stand where they demonstrated the value of synthetic farmyard manure. Messrs. JOSEPH FISON AND Co. had selections of manures for all crops. Messrs. GARDEN SUPPLIES, LTD., set out attractive cartons and tins of lawn sand, insecticides and manures. Tamarite occupied a prominent place amongst the specialties of Messrs. PRENTICE BROS. Messrs. PRICE'S PATENT CANDLE Co. had Gishurstine and Gishurst compound amongst their fertilisers and insecticides. Messrs. ROBINSON BROS. staged fertilisers with sprayers, watering cans and other appliances.

The large kiosk of Messrs. CORRY AND Co. contained a great variety of garden sundries. In addition to their Summer Cloud Shading they showed their Weed Death, Fowler's Mealy Bug destroyer, Niquas insecticide and Tar Oil winter wash; they had a novel wasp trap, and Woodlice and Ant Death, which is also said to bring mice, rats and rabbits from their holes. The RADIUM FERTILIZER Co. had manures and lawn sand. The SOUTH METROPOLITAN GAS Co. showed sulphate of ammonia and a weed-killer. Messrs. TIMOTHY AND SANDWORTH set out powder sprayers, insecticides and other specialties. Messrs. WAKELEY BROS. AND Co. showed their well-known Hop manure and, in another place, had garden ornaments. Fruit tree protectors were shown by WALKER'S PROTECTOR LTD.

Extensive displays of garden sundries of all kinds were made by Messrs. GEORGE MONRO, LTD., Messrs. WM. WOOD AND SON, THE ACME LADDER Co., and Messrs. DREW, CLARK AND Co., who held frequent demonstrations of their fixed and

FIG. 193.—CHELSEA SHOW: MESSRS. PULHAM AND SON'S FORMAL GARDEN.  
(see p. 382.)

the injurious, the neutral and the beneficial.

From the CHESHUNT EXPERIMENTAL AND RESEARCH STATION were sent plants and models illustrating certain diseases. The chief were the Mosaic diseases of Tomatos, Tobaccos and of the Aucuba. There were also plants showing the different stages of the foot-rot of Tomatos. In addition to these illustrations of plant diseases, there were scale models of apparatus, including a steam engine, for the steam-sterilization of the soil over large areas.

The SEALE-HAYNE AGRICULTURAL COLLEGE contributed specimens illustrating the diseases and pests of Daffodils, such as Narcissus Leaf-spot and Narcissus Bulb Eelworm, with others on Tulip Fire and the Rosellinia Rot of Arum (Richardia). The IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY was represented by electrical apparatus for measuring the rate of growth in plants. The LOW TEMPERATURE STATION FOR RESEARCH IN BIOCHEMISTRY AND BIOPHYSICS, Cambridge, contributed diagrams, photographs, fungous cultures, etc., illustrating certain phases of the Station's work in connection with the storage of fruit.

Dr. G. H. RODMAN had interesting observations concerning the leaf markings of species of Maranta and Calathea, and these were accompanied by living plants of Maranta insignis, M. Clossonii, M. Massangeana, Calathea

gardener appreciates the help he receives from the chemist as well as the inventor was fully evident from the great interest displayed by gardeners of all sexes, classes and grades in the exhibits so attractively set out and in the demonstrations performed with such dexterity by the various assistants.

The glasshouses and garden frames were very substantial, designed with great skill, and made of the best materials. Mr. DAVID SWAIN had a most useful span-roofed greenhouse, complete in every respect, of beautiful "lines" and particularly well made. He also showed garden frames in several very good patterns. Messrs. J. WEEKS AND Co. also had well designed glasshouses with approved ventilating gear and of sound workmanship. Messrs. DUNCAN TUCKER AND SONS are well-known as builders of commercial glasshouses, and they exhibited very desirable structures adapted for use in the private garden as well. Greenhouses and frames also of considerable merit and quality, were contributed by Messrs. BOULTON AND PAUL. Other exhibitors of glasshouses and frames were Messrs. G. HAYWOOD AND Co., Messrs. MESSENGER AND Co., who also had the necessary hot-water boilers and a good selection of garden seats; Messrs. A. OVEREND AND SONS, and Messrs. SKINNER, BOARD AND Co., who all displayed excellent structures.

extension ladders. Cutting tools were shown by Messrs. CAMP AND CO., Messrs. JAMES CARTER AND CO., who also had sprayers and many garden tools; Mr. JOB HANSEN, who also showed cultivators; Messrs. HOLTZAFFEL AND CO., Mr. C. A. JARDINE, Messrs. MELHUISE AND CO., Messrs. A. SMELLIE AND CO., who included well-made garden tools; Mr. B. J. WALKER, and the WILKINSON SWORD CO.

Well-made greenhouses and frames were displayed by Mr. JAMES GRAY. The CHASE CONTINUOUS CLOCHE CO. had their plant protectors. The CROWN OPTICAL CO. showed seed testers and various lenses. Garden furniture was set out by Messrs. GAMAGE AND CO., Messrs. ABBOT BROS., Messrs. CASTLE'S SHIP-BREAKING CO., the DISABLED SOLDIERS' INSTITUTE and the DRYAD WORKS.

The new patent shoulder hoe demonstrations attracted many visitors, who appeared to be impressed with the value of this tool. The COOPER-STEWART ENGINEERING CO. had sprinklers and hose. Mr. J. HAWS set out a wide range of his well-known patent watering cans and water carriers. Mr. A. B. JOHNSON had splendid turves and loam. Miss M. NALDER showed garden tools for children. The NEW CROSS TIMBER CO. set out rustic work.

Horse boots for use on lawns, sprinklers and tools were displayed by Messrs. H. PATTISON AND CO. Messrs. PIGOTT BROS. had garden tents and furniture. Mr. JOHN RICHES showed many patterns of his excellent metal labels. The HELICHRYSALABEL CO. exhibited their new pattern labels. Mr. B. PINNEY had a plant protector.

Large displays of garden ornaments in lead and stone were made by Messrs. SANDERS AND CO., by Messrs. PULHAM AND SON and by Messrs. BURTON HOLT, LTD. Messrs. ALLWOOD BROS. had sundries specially adapted for Carnation growers. The EN-TOUT-CAS CO. had a miniature tennis court and garden ornaments. Messrs. FOWLER, LEE AND CO. showed fruit bottling appliances. The HOUSE AND GARDEN SUNDRIES CO. demonstrated the handiness of their seed-sower and other appliances. Mr. J. SINGLETON showed his Nuesprays, and Messrs. T. J. SYER AND CO. had garden furniture.

## SOCIÉTÉ NATIONALE D'HORTICULTURE DE FRANCE.

PARIS was at her best on the occasion of the Centenary Exhibition of the Société Nationale d'Horticulture de France. The hundreds of thousands of trees along the boulevards were in their fresh green dress, as yet unspoiled by dust and drought. Moreover, the gardens and plantations were charming and in many of these public oases summer bedding was already well advanced.

As in connection with so many previous exhibitions, the venue was the Cours la Reine, a long and rather narrow site next the River Seine, and quite near the Pont d'Invalides. The area is far too small for a great exhibition, as both outside and inside the large, temporary, canvas-covered structure, exhibits were crowded and space for the movement of visitors was severely limited. Outside the building and from the entrance, towards it, large displays of trees and shrubs, mainly evergreen, were made, and also a wonderful exhibit of trained fruit trees. Here, too, near the river on the one hand and the roadway on the other, garden statuary, tea and summer houses, and horticultural buildings, were distinctly reminiscent of the Lime Avenue at Chelsea. Horticultural sundries, such as tools, spraying apparatus, insecticides and fungicides, found a place along the narrow strip between the building and the roadway.

Garden designs filled several side rooms on the river side of the building, where also was the Orchid annexe, while at the far end of the building a fine collection of paintings of flowers and garden scenes was housed, with displays by various horticultural journals and a few scientific exhibits.

President Doumergue opened the exhibition on Wednesday, May 25, and was accompanied by various Government officials, including the Minister of Agriculture and municipal notabilities

of the City of Paris. The attendance was good and especially so on the 26th—Ascension Day and a semi-holiday. Closing day was June 3, by which time we imagine most of the exhibits presented a very dusty and tired appearance, notwithstanding several renewals in the case of cut flowers.

So far as exhibits were concerned, Great Britain was but poorly represented, the only exhibits from this side of the Channel being one of Orchids from Messrs. STUART LOW AND CO.; one of paintings, from Miss WINIFRED WALKER; and the display of coloured plates, half-tone supplements and reproductions of portraits of notable French horticulturists from *The Gardeners' Chronicle*.

Judging commenced at 8.30 a.m. on the opening day. The jury was a distinctly international one, including many friends from Belgium, led by the Comte de Kerchove and others from Holland, with Mr. E. Krelage as their recognised leader.

Dr. Hill, Director of Kew; Mr. E. A. Bunyard,

work the S.N.H.F. had done during its hundred years of life. He also briefly reviewed the history of the Society over which he presides so ably.

The Comte de Kerchove made a most charming congratulatory speech, and Mr. Krelage, who responded for the foreign representatives, pointed out that while Holland and Belgium were strongly represented in personal and exhibits, the small attendance from Great Britain could be accounted for by the fact that Chelsea Show was opening on the same day and therefore keeping away many who would otherwise have been delighted to come.

In concluding the proceedings, the Minister of Agriculture announced that the French Government had honoured the Comte de Kerchove and Mr. Krelage with special decorations, while several Frenchmen had also been honoured, and one Englishman.

Considered as a whole, the exhibition was a fine one, and if the site had been half as big again the exhibits would have filled it easily, and visitors would have had better opportunities

FIG. 194.—PARIS CENTENARY SHOW: VIEW SHOWING THE EXHIBIT OF MESSRS. VILMORIN-ANDRIEUX ET CIE.

Maidstone; and Mr. F. Oldham, Windlesham, represented the Royal Horticultural Society, and formed a deputation that made several Awards which were greatly appreciated. Mr. C. H. Curtis appeared to be the only other British horticulturist present, and he acted as one of the judges of Orchids.

After the completion of judging, and following the opening ceremony, the judges and leading exhibitors were entertained by the National Society at a banquet given at the Society's headquarters in the Rue de Grenelle. The Minister of Agriculture presided, and was supported by M. Fernand David, President of the Society; M. Nomblot, General Secretary; the Comte de Kerchove, Madame Philippe de Vilmorin, M. Rabier (who presided at the International Conference in 1926), Mr. Krelage, Dr. A. C. Hill, M. Chatenay and others. There were probably about two-hundred-and-fifty present.

After the banquet M. Nomblot announced the principal awards made by the Superior Jury, and M. David extended a warm welcome to horticulturists of other nations who had come to pay their tribute of regard for the great

for closer examination of the plants and, incidentally, the opportunities for business would have been greatly increased. However, the Cours la Reine provide the only available site that is convenient for the purpose, and our French friends, with the co-operation of horticulturists from Holland and Belgium, made the most of their opportunities and secured an exhibition of which they cannot fail to be proud, to mark the Centenary of their great and useful Society. We extend our heartiest congratulations to all concerned, and venture to hope that in future two great shows held by two important national societies may be arranged for dates that do not clash.

### The Vilmorin Display.

MM. VILMORIN-ANDRIEUX ET CIE were the largest of the exhibitors on this auspicious occasion, and they occupied a central position in the exhibition (Fig. 194). As on so many other occasions, the general plan of the display was a hollow square, but in this case, with one side rising higher than the rest, with the middle portion so arranged with contrasting annuals as to appear like a flight of steps, with golden

Anthemis forming the balustrading. The whole of this wonderful exhibit consisted of annuals or plants that may be treated as annuals. Purple Stocks filled the centre, with a surround of grass; then came beds of Mallows, Petunias, Tropaeolums, Nemesises, and then, on the rising sides, great breadths of fragrant Stocks in a great variety of colours, Schizanthuses, Iceland Poppies, Marigolds, Petunias, Anthemis, Antirrhinums, Rhodanthes, Verbenas—very fine in form and colour; while on the outer edge, just within the grass verge, there ran all round the display a solid, golden band of Gamolepis Tagetes.

On the higher side a terrace and colonnade were arranged, planted with Anthemis and Mallows in variety.

Running parallel with this great effort, the firm of VILMORIN showed, on the one side of the hall, Irises and Sweet Peas. The former were very handsome, and new sorts were Fra Angelico, light bronze standards and pale mauve and bronzy falls; Leonardo da Vinci, bronzy-fawn standards and smoky-crimson purple falls; Paul Veronese, pink standards and purple-blue, white-striped falls; Pericault, dark purplish-crimson falls and bronze, blue-shaded standards; Bellatrix, golden bronze standards and crimson, yellow-veined falls; Mignard, mauve; and Ingres, rich golden bronze, with golden bases to the crimson, white-striped falls. Sweet Peas were good and prettily arranged, but we see better at home.

On the opposite side, the space was devoted to groupings of Antirrhinums of many colours, double Poppies, single Poppies, annual Chrysanthemums, climbing Tropaeolums, a fine strain of Foxgloves, Canterbury Bells and Cinerarias of the stellata type. Nor must we omit the little rock garden at the back of the aforesaid terrace, wherein we noted very deep-hued forms of Primula japonica, Aster alpinus, Nempervivum nigrum, a cream-coloured Alysium, Campanula Portenschlagiana, Linarias, Helianthemum Golden Queen and Dianthus Pauciflorus.

Not content with this huge exhibit, M.M. VILMORIN filled a greenhouse with large and small-flowered strains of herbaceous Calceolarias, Primula obconica in a great variety of colour shades, from pure white to crimson, and an extensive array of models of vegetables. Further, M.M. VILMORIN exhibited a large collection of garden tools and in addition made a display of vegetables and salads that must have been at least fifty yards long and about eight feet wide. This wonderful assemblage of seasonable vegetables and salads included many varieties rarely seen in England, notably the white and yellow Cucumbers, and the long-rooted white and white and purple Turnips. Lettuces and Endives were presented in large variety and size, as also were Cauliflowers. Peas, as growing and cropping, as well as Tomatos, formed an interesting background to this vast display, which was arranged very little above ground level just outside the main building.

Madame PHILIPPE DE VILMORIN was justly proud of the Homeric and successful efforts of her staff in Paris and Verrieres, and made no effort to dissemble her gratification when told that M.M. VILMORIN had been awarded the principal prize, offered by the President of the Republic.

#### Exhibits Under Cover.

A big exhibit by M. L. FERARD, designed to show the lower slopes of a mountain—with snow on the scenic background—was quaint in conception but hardly to scale. Pines topped the grassy slopes, and little groups of Campanula and Helichrysums occupied niches on the precipitous side. Where the ground sloped less sharply a great drift of Foxgloves ascended to the "timber line," while lower down and at the foot were groups of Potentillas, Asters, Campanulas Arums (the golden ones were quite out of place), Veronica (Hectori, V. salicoides), hardy Ferns, Primulas and Lilium regale.

M. M. DEFRESNE ET FILS, Vitry, contributed a fine collection of Roses in all sizes from dwarfs to climbers and big weeping standards; this firm provided a capital Rose garden, and their weeping standards of Excelsa, Dorothy Perkins and Lady Godiva were greatly admired. We

saw nothing especially attractive in the new varieties submitted.

M. M. MOSER ET FILS, Versailles, displayed a large Rose garden at one end of the building, and their effort must have cost much labour and expense. On a sunken lawn a central Lily pool was margined with French Marigolds; around this, on grass terraces, the large beds of Polyantha Roses thoroughly deserved the admiration they received. At the back was a colonnade, festooned with climbing Roses and having a central arbour of Roses sheltering a piece of statuary—a pensive lady. All around this garden, and outside its paths, were other arbours and trellises covered with Roses. The Polyantha varieties in the beds referred to were Kesters Orleans, Jessie, Orleans Rouge (very rich in colour), Triomphe Orleansais (deep red), Mrs. W. C. Konig (white), Lady Reading (rose red), Verdun (very bright), and Madame Jules Gauchicault, pink. Jules Potin, a new Pernetiana variety, has large, light yellow flowers of good shape and borne on long stems; this was shown by M. M. MOSER.

A brilliant exhibit by M. M. CAYEUX ET LE CLERC, Paris, was composed largely of bearded Irises, which were presented in great sheaves of each variety—Soliman, Duke of Bedford, Jacqueline Guillot, and Bruno were particularly fine. Paeonies, Asters, Nemesises, Crepis and Schizanthuses formed a large bed within the flanking masses of Irises.

Hydrangea specialists found much to admire in the circular group of these plants arranged by M. H. CAYEUX, Ville de Havre Gardens. Most of the varieties were new, and many of the seedlings were as yet unnamed. Two new sorts that made a special appeal to us were Champion, a very beautiful variety of deep cerise-pink colour and tiny white eye; and Normandie, rich reddish rose, with very large "pips," paler at the centre; this had great heads of bloom. Sensation, a lovely deep blush-pink, with creamy eye, and Ginette, white, were also good.

As became one of the first firms to raise new garden Hydrangeas, M. M. E. MOULIERE ET FILS showed a large group of finely grown Hydrangeas (Fig. 195) in which the new variety Marie Pierre Filipo, very deep reddish rose, was very distinct and effective. Other fine sorts included the older Madame Moulière, the pink and white Prof. D. Bois, the dark rose America, and the blue form of America.

M. GEORGES TRUFFAUT, Versailles, displayed the deepest blue-coloured Hydrangeas in the show, and grouped these under Palms in the back of a large exhibit that was a veritable valley of Roses—all Polyantha varieties. In the foreground were other Hydrangeas, notably a fine pink variety named Triomphe. In another part of the exhibition, M. G. TRUFFAUT demonstrated his numerous biological studies and work in plant-breeding.

M. F. A. TRUFFAUT, Versailles, had a capital exhibit of Hydrangeas, some of exceptional deep blue colour, but the collection of Kurume Azaleas was the most interesting part, and the white variety named Isuta Mongii was one of the best of many beautiful sorts.

M. M. CROUX ET FILS, Chatenay, were amongst the most extensive exhibitors of Rhododendrons, and although their large and splendidly flowered plants were massed rather closely, they nevertheless made a fine display, and one that arrested attention by reason of its brilliance; two of the groups were each about twenty-five yards long, and some twenty feet deep. Varieties of outstanding importance included the old Everestianum, Lady Cathcart, Robert Croux, deep crimson; The Strategist, deep pink; Louis d'Andigne, brilliant rose and orange; Madame Marie Van Houtte, white; Michael Waterer, red; and Princess Mary of Cambridge.

Between these two big beds or borders of named sorts the same firm filled a large bed with some of their own seedling varieties, and of these a few notable sorts were Madame Jules Fontaine, violet-rose, white and orange; C. Nicolas Potocki, scarlet and pink; Pres. Felix Faure, red, shaded deep pink; and Maurice Croux, white, widely margined with soft rose-pink, and with light orange-yellow spots on the lower lobe.

Just within the chief entrance, M. M. Aug.

NONIN ET FILS, Chatillon, provided an effective display of Roses in beds, on pillars and pergolas, dwarfs, standards, weeping standards and climbers. Excelsa, Dorothy Perkins and American Pillar and Paul's Scarlet Climber are popular sorts in France, judging by the frequency with which they were shown. Among the dwarfs, Joseph Gay, red; Souv. de Claudius Pernet, rich yellow; Mrs. W. C. Miller, pink; and Elvira Aremayo, light scarlet, were prominent varieties.

A particularly bright spot was composed of a circular bed of an excellent strain of Calceolarias with spotted flowers, and a semi-circular exhibit of Begonias. The former were displayed by M. VALTIER, Paris, and the Begonias, all named, by M. A. BILLARD, Le Vesnet; an interesting variety and represented largely was named Paul Parré, a creamy-pink, double, fringed variety of apparently very dwarf habit.

The best of the Paeonies shown by M. M. DORAT ET FILS, La Pelisse, were Verdun, a vivid crimson, single; La Fiancee, white, single; Elisa, clear pink, semi-double; and Princess Mathilde, single, broad petalled, a lovely shade of rose-pink, with a central boss of golden stamens and anthers. Pelargonium Aurore, a zonal variety of bedding type, was an attractive new sort exhibited by M. F. OLIVET, Paris; it is of light and bright yellowish-orange colour with a fairly large white eye.

Other exhibitors were M. ANT. POSMOURNY, Colombes, who displayed a Japanese garden; M. THUILLEUX, Roses; M. M. VALLERAND FRERES, Osieres, Gloxinias and Begonias; M. CHAS. WEISS, St. Cloud, dwarf Japanese trees; M. G. THIEBAULT, Paris, a collection of Cacti, arranged as though growing naturally, with a Mexican scene for a background; M. HENRI BARRI, Paris, Japanese dwarfed trees and miniature Japanese gardens.

The Parisian florists made charming contributions of floral designs, M. LAUCHAUME, M. CHARLOT and M. ANDRE BAUMANN each filling a large space, but the outstanding attraction of this section was the display by M. EDOUARD DEBRIE, whose old lady—with young features—in a hooped skirt, embroidered with Pyrethrum, was the central feature of designs contrasting floral art of 1827 with that of 1927.

Around a large batch of standard Roses, placed too closely together for our taste, M. M. LEVEQUE ET FILS, Ivry-sur-Seine, exhibited dwarf Roses in great variety; Reims, soft creamy yellow; Souv. de Georges Pernet, the old Dean Hole, in capital form, and Mrs. George Beckwith, were the varieties that attracted our attention.

#### Educational Exhibits.

An extensive and interesting collection of economic plants was arranged in a span-roofed greenhouse by M. BOIS, of the Natural History Museum and Jardin des Plantes. Limits of space prevent a detailed account of the wide range of subjects exhibited, and be it stated, the plants were in better case than it is usual to see them. Just a few we noted in a brief inspection during a crowded period were Sansevierias, Agaves, Phormium and Boehmeria nivea, among fibre plants; the Avocado Pear, Cherimolier, Loquat, Banana, Guava, Monstera and Litchi, among fruits; and Citron Grass, Tea, Coffee, Cocoa, Coca, Kola, Pepper, Pimento and Clove, among plants used for perfumery, drugs and drinks. Every plant was duly labelled showing its use, country of origin and botanical name.

Very many years have elapsed since we saw so many and such fine examples of Platyceriums—Elk's Horn Ferns—as those sent from the princely gardens of Monte Carlo. Three specimens of Platycerium grande were outstandingly fine; besides there were big specimens, over four feet wide, of the old P. alcinorum, and examples only a little smaller of P. Willinkii, P. Hillii and P. Hillii majus. A background for these grand specimens was provided by big examples of Pandanus Veitchii and P. Sanderiana, while many large plants of Asplenium Nidus Avis—the Bird's Nest Fern—together with Anthuriums and masses of brilliant Bougainvillea completed this very fine contribution.

From the SCHOOL OF HORTICULTURE at Versailles came a mixed exhibit, consisting of Caladiums, Philodendrons, Dracaenas, Schizanthuses, Begonias and fruit trees in pots, the examples of Plums and Cherries carrying excellent crops.

#### Outdoor Exhibits.

Shapely specimens of Box, Yew, Privet and Holly were associated with good examples of *Picea Kosteriana*, *Cedrus atlantica glauca*, *Magnolia floribunda*, *Osmanthus ilicifolius*, *Ilex crenata* and *Phillyrea angustifolia* by M. THIELLEAU, St. Cloud, in a formal arrangement of beds.

Japanese Maples and other trees and shrubs made a pleasing setting for four large beds of the *Polyantha* Rose Edith Cavell, exhibited by M. G. MARTIN LECONTE, Louvenciennes.

Very wonderful examples of trained fruit trees were displayed by M. M. NOMBLOT-BRUNEAU, Bourg-la-Reine. These, with more freely grown trees, made up a quite extensive fruit garden. The large, fan-trained Pears, attached to trellises, every branch spurred like a single cordon, drew expressions of wonderment from the many British and American visitors who had not previously seen anything of the kind. Some of these specimens of patient cultural skill carried good crops of young fruits, notably the trees of Doyenné du Comice and Bergamotte Esperen. No less wonderful were the large, goblet-shaped trees of Pears, Plums and Apples, each on a clear stem—like a gigantic wine-glass. The cylindrical, pillar-shaped trees were equally attractive, and well-cropped standards of Red and White Currants and Gooseberries attracted the attention of the young folk. In passing we may add that we cannot remember ever to have seen so many children, young lads and maidens, attending the two first days of a flower show, as on this occasion.

A handsome group of evergreen trees and shrubs was finely arranged by M. PAUL LECOLIER, St. Cloud, with a low rock garden in the foreground; *Cedrus Deodara argentea* and *Juniperus Sabina* were capital specimens, the latter over six feet high and above ten feet through.

Japanese Maples were well and largely shown by MM. CROUX ET FILS, Chatenay, who displayed many examples of the dark, red-leaved form (*atropurpureum*) and a big example of *Acer palmatum crispum*, around a very big specimen of *Rhododendron Princess Helene*. *Cupressus Lawsoniana minima glauca*, a dense little bush about eighteen inches high, also attracted lovers of Conifers.

#### Orchids.

The Orchid section at the Paris show was a small affair as compared with the display of these flowers at Chelsea. Most of the groups were located in an annexe to the exhibition building.

M. BLEVENEC, Colombes, contributed a series of *Laelio-Cattleyas*, but showing little variety of colouring. M. M. C. MARON ET FILS, Brunoy, showed a capital group in which three plants of *Phalaenopsis Rimestadiana*, each carrying one long spike with nineteen, twenty-one and twenty-three flowers respectively. *Miltonias* were also shown well by this firm, and the group included *Laelio-Cattleya Canhamiana*, *Oncidium varicosum Rogersii*, *Cattleya Mossiae* and C. M. Wagneri.

M. GUTTIN, Argenteuil, contributed a showy set of *Cattleyas*, *Brasso-Cattleyas*, *Odontoglossums* and *Odontiodas*, and was awarded an *Objet d'Art* for it. M. MORCOZ displayed his *Cattleyas* and *Odontoglossums* pleasingly among suitable foliage plants and tree branches, thus giving the group a natural appearance. *Laelio-Cattleya Canhamiana alba* and *Cattleya Mossiae* were very good in this group.

M. LEON PERRIN, Clamant, staged a very fine lot of *Vanda suavis*, all the plants carrying several spikes of flowers; *Miltonias*, *Renanthera* *Imshootiana* and *Brasso-Cattleyas* were grouped around the *Vandas*. M. VACHEROT-LECOUFFLE, Boissy St. Leger, contributed one of the most attractive groups.

Although his plants were small they were well flowered and consisted of *Odontioda Charlesworthii*, *Renanthera Imshootiana*, *Thunia*

*Bensoniae*, *Cypripedium Curtisii*, and *Odontoglossums* in variety, and two beautiful examples of *Miltonia Memoria G. D. Owen*, one carrying six and the other four spikes of handsome flowers.

In the Belgian section, M. M. VERDONCK, Gendbrugge, arranged a very pretty group in front of mirrors. He had *Odontoglossum grande*, *Laelio-Cattleya G. F. Ball*, *Miltonias* in variety, and a selection of hybrid *Odontoglossums*. M. JANNSEN also showed a few Orchids, while M. BINOT, the collector, showed specimens of several species of *Oncidium* as imported from Brazil.

The only British exhibitors, Messrs. STUART LOW AND CO., were hampered by lack of space, and they were unable to make the best of their plants. None the less, they had an attractive group in which the bright *Sophro-Laelio grangei* *fieldense* showed up among *Cattleya Dowiana*, *Cypripedium Rothschildianum*, *C. niveum*, *C. callosum Sandersae*, *Laelio-Cattleya Goldflake*, L. C. G. D. Ball, and various showy *Odonto-*

both shown by M. BAARDSE, of Aalsmeer. Both were very fine but the *Cyclamens* were particularly good.

Towards one end of the section, M. BAARDSE arranged a magnificently grown lot of *Hydrangeas*, every one carrying a single head of splendid size; *Mignon*, a dwarf blue; *Konigen Emma*, rose pink; *Mevrouw Baardse*, light pink and compact; *La France*, a deep blue; *Deutschland*, deep rose-pink, with extra large pips; *Konigen Wilhelmina*, pink; and *Bagatelle*, blue, shaded with white, were the leading varieties.

To the Dutch growers for their splendid collective contribution a special award was made, while individual growers obtained recognition of their efforts in the form of medals and works of art.

Alongside the large space occupied by the main exhibit from Holland, there was an equally interesting display, part of which was devoted to floral art—including a gigantic vase of *Lilium longiflorum* and *Eremurus*; a huge basket of mauve Sweet Peas and

FIG. 195.—PARIS CENTENARY SHOW: VIEW SHOWING MESSRS. MOULLIÈRES HYDRANGEAS IN THE FOREGROUND.

(see p. 402).

*glossums* and *Odontiodas*. Messrs. STUART LOW AND CO. were awarded the *Objet d'Art* offered by Madame Potin.

#### Dutch Section.

The Dutch section was a large one, and a wonderful effort of organisation. It consisted principally of Lilac, Roses, *Hydrangeas*, *Cyclamens*, *Calceolarias* and *Begonias*, but this bare statement conveys no idea of the beauty, colour and fragrance provided by the splendid display.

The great, central feature consisted of about thirty big vases of white and coloured Lilac, chiefly white, and how the Aalsmeer growers had contrived to retard the plants so severely and yet produce such beautiful spikes is known only to the clever growers themselves, who are to be congratulated on winning the beautiful trophy which we figure on p. 391. Around the masses of fragrant Lilac, bowls and baskets of Roses were arranged, the leading sorts being *Souv. de Claudius Pernet*, J. C. Mensing, *Madame Butterfly*, *Wilhelm Kordes*, of lovely colour; *Ophelia*, *Columbia* and *Hadley*, crimson, in great numbers. In this same great, central portion of the formally designed Dutch garden, there were opposite, semi-circular groups of *Begonia Gloire de Lorraine* and *Cyclamens*,

pink Roses; red Roses combined with *Mignonette* and *Glory of Moordrecht* Fern (a descendant of *A. Farleyense*), and a free use of *Anthuriums*; big groups of the dull orange *Azalea Princess Juliana*, a large-flowered *Mollis* variety; large standards of the brilliant *Doncaster Rhododendron*; a large bed of the bright *Polyantha* Rose *Golden Salmon* (figured in our issue of May 28); groupings of *Glory of Moordrecht*, *Johan Bier*, lovely Ferns of the *Adiantum Farleyense* type; and a great display of Spanish *Irises* contributed by the BULB GROWERS OF HOLLAND. Altogether the Dutch growers had every reason to congratulate themselves, and they could not help but know that their efforts met with general admiration and appreciation.

#### Belgian Section.

Although the Belgian growers failed to make such an arresting collective display as their Dutch contemporaries, they, nevertheless, acquitted themselves right well. A large bed of brilliant *Azaleas* and *Rhododendrons* occupied the central position; the plants were shown by M. T. PIENS, Melle, Ghent, and included the brilliant scarlet *Azalea Apollo*, smothered with flowers; other good varieties were the light pink *Haerensiana* and the deep pink *Madame Jean Haerens*.

All around were fine groups of large Palms

and Bromeliads, Cycads, Philodendrons and Araucarias submitted by M. DALLIERE, Ledeberg; M. de COSTER ANDE; M.M. BIER and ANKERSMIT, Melle; THE FLANDRIA Co., Bruges; and M. J. P. HARTMAN, of Mont. St. Amand. Brilliant Anthuriums, chiefly of the Scherzerianum section, were shown in quantity by M. VANDE PUTTE, Meirelbeke and, as usual, attracted a great deal of attention. M. DESIRÉ DRAPS, Brussels, contributed finely-grown Hydrangeas, and among these we noticed La Cygne, white; Pier Gynt, rose and white; Loreley, deep pink, fringed; Elmar, deep, reddish rose; and Madame Désiré Draps, a pretty light rose-pink sort. M. EMILE DRAPS, Merxem, Antwerp, showed many large vases of beautiful Carnations rising above a collection of Bromeliaceous species, one of which, Aechmea Reukartianum, carried a tall spike of scarlet flowers. M. J. L. DRAPS, Doim, also sent Hydrangeas.

Grapes, Peaches and Nectarines, all well-grown, were exhibited in glass cases by the SYNDICAT DES VITICULTEURS BELGES; the fruits were grown mostly in the quaint old town of Hoeyleart, and the surrounding district.

#### Royal Horticultural Society's Awards.

*Special Work of Art* (see Fig. 187).—To the HORTICULTURAL UNION OF AALSMEER, for the contribution of Lilac and Roses to the Holland section.

*Gold Medals*.—To MM. VILMORIN ANDRIEUX ET CIE., for their vast and varied display; to MM. CROUX ET FILS, Chateaux, for Rhododendrons; to M. DEFRESNE, Vitry, for Roses; to the EXPOSITION HOLLANDAISE; and to the EXPOSITION BELGE.

*Silver Flora Medals*.—To MM. C. MARON ET FILS, Brunoy, for Orchids; to MM. VACHEROT-LECOUFLE, for Orchids; to M. CHANTRIER, for Caladiums, etc.; to the VILLE DU HAVRE (M. Cayeux, Supt.), for new Hydrangeas; and to the PUBLIC GARDEN OF MONTE CARLO, for Platyceriums, Pandanus, etc.

*Silver Banksian Medal*.—To M. THIEBAULT, for Cacti.

#### VALE OF EVESHAM ASPARAGUS GROWERS'.

THE third annual show, held in Evesham, on Wednesday, May 25, in connection with the Vale of Evesham Asparagus Growers' Association, and in aid of the Evesham Hospital, was the most successful during post war years. The entries numbered 133, which is much more than double those of last year, and represented a total of about 170 bundles of Asparagus.

Never before, since its introduction to the district in 1850, has Asparagus commanded so much attention as at this show, and the prize-winning bundles were most meritorious.

The Silver Trophy offered for the best bundle in the show was won by Mr. L. J. JELFS, of Bretforton, and at the subsequent auction realised £6 2s. 6d. Mr. H. OSBORNE, of Badsey, won the Silver Cup offered for the best flat of four bundles, which was sold for £8 10s. 0d., and Mr. J. COOKE, of Littleton, won the Silver Cup offered for the heaviest bundle of 120 heads of Asparagus. Mr. COOKE's exhibit weighed 17½ lb., and was sold for £5 15s. 0d. The amount raised at the sale, by exhibits alone, was £156, and the total proceeds of the show, which include the sales of produce from various stalls arranged by villagers, was about £230.

The President (Mr. C. A. Binyon, J.P.) presided at the luncheon, supported by the Mayor of Evesham (Councillor J. Edwards), Sir Julius Sladden and Mr. A. Woodall (Vice-Presidents), and Mr. A. S. Boaler (Hon. Secretary). The Mayor welcomed the show to Evesham again after many years' absence, and Mr. E. W. Beck thanked the Association for donating the profits to the Hospital fund.

Reports regarding the progress being made by the three Research Stations into the nutrition and disease side of the crop were given by Mr. R. C. GALT (Agricultural Organiser for the County of Worcester); Mr. R. M. NATTRASS (Long Ashton, Bristol University, Research

Station), and the President, who spoke on behalf of Mr. A. Appleyard, of Campden Research Station. Regarding the new seed introduced from America by Mr. Appleyard, the President said that it was showing fair promise, and roots had been distributed to various growers. Mr. NATTRASS, who is conducting experiments of Asparagus beds with infected and with virgin soils at Long Ashton, said that soil sickness seemed to be the reason for the industry drifting away from Evesham. Mr. GALT suggested that as the pruning knife was said to convey disease among Black Currants, so the cutting knife might convey the fungous disease among Asparagus.

Mr. Barnett Emanuel, of Covent Garden, London, urged growers to send Asparagus to market in smaller bundles during rush periods, when the French, Californian and Argentine produce was on the market.

The following are some of the chief prize-winners, in addition to those mentioned above:—Class A, for members only: Mr. H. WITTS, Littleton; Class B.—Flat of four bundles: Mr. W. H. JELFS, Badsey; Class C: Mr. W. C. HALL, Badsey; Class D: Mr. H. BELCHER, Childswickham; Class E: Mr. JAMES KNIGHT, Blackminster; Class G: Best machine-tied bundle: Mr. J. COOKE, Littleton; Class H.—Commercial Asparagus: Mr. H. PRINT, Childswickham.

#### GUILDFORD AND DISTRICT GARDENERS'.

Two very enjoyable outings were arranged by this Association in May; the first outing was on May 11, when, by kind permission of Theodore Pim, Esq., the members visited Snowdenham Hall, Bramley, Surrey. The gardens at Snowdenham are very beautiful, and the visit was greatly enjoyed by the party. The return journey was made by Cranleigh Holmbury and Newlands Corner. On Saturday, May 21, members visited New Place, Haslemere, by kind permission of Lady Methuen; the visitors were conducted through the gardens by the gardener, Mr. Grant. Standing near the house, the view across the lawn, away over a forest of all shades of green on to the bare Sussex downs is entrancing. Every Sunday afternoon in May and June the gardens are open to the public, when visitors to the number of 150 or 200 enjoy the privilege. Lady Methuen provided refreshments for her guests. Before leaving, Lady Methuen presented to Mr. Patrick a little booklet, profusely illustrated, descriptive of her garden, and a second copy for the use of the members.

#### Obituary.

**J. Barnard**.—We learn with deep regret of the death of Mr. James Barnard, for many years gardener at Mostyn Hall, Flintshire. Mr. Barnard, who was seventy-three years of age, retired from Mostyn Gardens some time ago and resided with his son and daughter-in-law, Mr. and Mrs. R. Barnard, at Ffynmongroew. He was Secretary of the Whitford and Mostyn Garden Society for sixteen years, and associated himself with the social activities of Mostyn in other directions. He leaves a widow, two sons and one daughter.

**H. T. Huggins**.—The numerous friends of Mr. H. T. Huggins will be sorry to hear of his death, at Chelmsford, on May 25, in his eighty-third year. He was manager of Messrs. Cooper, Taber and Co., Limited, wholesale seedsmen, of Southwark Street, since the inception of the firm in 1887, and previous to that he was partner in Messrs. Waite, Burnell Huggins and Co., at 79, Southwark Street. Mr. Huggins was held in the highest respect by members of the seed trade, and his long experience of the trade was always at the disposal of his friends.

**David King**.—Many Scottish horticulturists, as well as a number south of the Border, will regret to learn that Mr. David King, Osborne Nursery, Edinburgh, passed away on the May 27, after a short illness. Mr. King com-

pletely lost the sight of both eyes four years ago, but he retained his good health up to a few weeks before his death, although it must have sapped his robust constitution to some extent. Mr. King, who was seventy-five years of age, was predeceased by Mrs. King many years ago, and he is survived by his two daughters, who, during the past four years, have been of great assistance to him in the conduct of his business. Mr. King, of whom a portrait appeared on page 89 of vol. LIII of *The Gardeners' Chronicle*, was born at Bo'ness, and commenced his gardening career at Midfield Gardens, near Polmont, and afterwards served in those of Kinfauns Castle, Gartmore, and Brechin Castle. In 1874, when but twenty-one years old, he started business at Murrayfield, where he built up a large trade in the growing of plants, more especially Ferns, for market, and about forty years ago he introduced to the Edinburgh Flower and Fruit Market forced Tulips and Hyacinths in bowls for Christmas decoration. Mr. King took a great interest in horticultural affairs in Edinburgh. He served for a considerable number of years on the Council of the Scottish Horticultural Association, of which he was President in 1913 and 1914, and also that of the Royal Caledonian Horticultural Society; and when the Scottish Association was incorporated in the latter Society in 1921, he was elected President of the Royal Caledonian Society, which post he occupied for two years. He was also for a few years a Governor of the East of Scotland College of Agriculture, and for a considerable number of years he was President of the Edinburgh Market Gardeners' Association, which office he held up to the time of his death. In 1924 he was awarded the Neill Prize, as a cultivator, by the Council of the Royal Caledonian Horticultural Society.

#### ANSWERS TO CORRESPONDENTS.

**NAMES OF PLANTS**.—*Thames*. 1, *Acer platanoides* var. *Schwedleri*; 2, *A. macrophyllum*; 3, *A. pseudo-platanus* var. *aucubaefolium*; 4, *A. dasycarpum*; 5, *Pyrus lobata*; 6, *Spiraea prunifolia* var. *florae pleno*; 7, *Berberis vulgaris* var.; 8, *Lycium barbarum*. *A. C.* *Ceanothus dentatus*. *H. N. G.* *Cydonia japonica*. *W. F. H.* *Prunus Padus*, the Bird Cherry. *F. J. W.* 1, *Pulmonaria longifolia*; 3, *Trollius europaeus*; the other labels were detached; white flowers, *Asperula odorata*; woolly foliage plant, *Stachys lanata*. *H. C.* *Tritonia crocata*.

**SULPHATE OF COPPER AND GREEN ALGAE**.—*H. P. K.* The regulation amount of sulphate of copper is 1 lb. to 100,000 gallons of water, and this quantity does not harm Water Lilies, and presumably it would not harm Watercress. To find the quantity of water in any given bed, multiply the length by the breadth, and that by the average depth of the water. Each cubic foot contains six-and-a-quarter gallons, so the above sum should be multiplied by six-and-a-quarter to find the number of gallons in a bed. Presumably a bed would not contain 100,000 gallons, so that four ounces of sulphate of copper would be sufficient for 25,000 gallons; two ounces for 12,500 gallons; one ounce for 6,250 gallons; and half-an-ounce for 3,125 gallons. The crystals can be put in a bag and trailed through the water at short intervals until they are all dissolved and pass into the water. This may require to be done once or twice a season. If the Algae are in large, dense trails, as *Vaucheria* often is, it would be policy to rake out the larger colonies. The copper sulphate being poisonous, it might be advisable to flush the beds with a greater flow of water some time before Watercress is gathered for use. If newly cut, before applying the sulphate of copper, this would not be necessary.

REMARKS.—Double White Narcissus will be practically finished this week, therefore more attention will be given by buyers to double white Pyrethrums and white Stocks,

the prices of which are expected to remain firm. The supplies of coloured varieties of Pyrethrum are increasing almost daily, with a general improvement in quality. Scarlet and white blossoms will be in more demand during this week end for the Whitsuntide festivities. There is a plentiful supply of white Carnations, but good pink and scarlet blossoms are limited in numbers, and a further advance in their prices is anticipated this week. White Roses have been very scarce, small consignments of Frau Karl Druschki are now on sale, and a few boxes of Mrs. J. Laing have been received during the past week. Madame Butterfly, Madame Abel Chatenay, Golden Ophelia and Roselander are the most plentiful amongst the coloured varieties. A few Delphiniums and Gaillardias are the newest subjects in this department. Corocopsis and Shasta Daisies are arriving in much better condition. Richardias (Arums) are now practically finished for the season, and those on sale are not to be recommended. Lilium longiflorum is very good in quality and the quantities more than sufficient for present requirements. A few blooms of Lilium candidum have been on sale during the past week. White and coloured Paeonies also Gypsophila elegans are still arriving from France in good condition. Blue and pink Cornflowers, Gladioli and Sweet Peas are all much improved in quality. Large consignments of Irises have been received from Guernsey, but the quality is somewhat varied, and owing to large consignments arriving daily these blossoms are offered at very cheap prices.

REMARKS.—Business has been brisk during the past week. A considerable volume of produce is being handled and with fine weather the demand is active. English hothouse fruits, such as Peaches, Melons, Nectarines, Figs, Grapes and Strawberries, are all a good trade. The demands of the London season, especially during Derby week, are fairly large for choice fruits. Apples from Australia are a good market, especially for best sorts. French Cherries are arriving in variable condition and sound fruit

is selling well. Apricots are being sent in large quantities from Spain and are selling comparatively cheaply, but the fruits are not very good in quality. English Gooseberries were a very poor trade last week owing to competition with Dutch Gooseberries. Forced Peas are cheaper owing to increased supplies from out-of-doors. English Asparagus is a moderately good market, although the quantities on sale are fairly heavy. French Beans have been in demand, but at the time of writing there is an easier tendency in their prices. Mushrooms have been plentiful and cheap. New Potatoes from all sources are in heavy supply, consignments being mainly from Spain, St. Malo and Jersey. English Tomatoes increase in quantity almost daily, but their value is being well maintained. Cucumbers are also selling fairly well, the warm weather being favourable to the consumption of salads. Green vegetables are not a particularly good trade.

## GLASGOW.

Markets were closed on the occasion of the annual holiday on Monday, and business has since been transacted on a moderate scale at steady prices. In the cut flower section English Irises were worth from 8d. to 1/2 (12's); German Irises, 3d. to 4d. (6's); Pyrethrums, 2d. to 5d. per bunch; Sweet Peas, 6d. to 1/-; Paeonies, 10d. to 1/2; Clara Butt Tulips, 6d. to 8d. (6's); Anemones, 3d. to 5d.; Lilium longiflorum (Harrisii) and Richardias (Arums), 3/- to 3/6; Gladioli (large), 2/- to 2/6 (6's); Lily-of-the-Valley, 2d. to 4d.; Asparagus Fern, 3d. to 1/-; pink Roses, 3/- to 4/- per dozen; red Roses, 1/6 to 3/-; white Roses, 1/6 to 2/6 and Carnations, 2/6 to 3/- per dozen.

Bedding plants were in better demand, and prices improved all round. Marguerites realised, 2/- to 3/- per dozen; Calceolarias, 3/- per box; Gladioli, 1/6 to 2/-; Lobelia, 2/- to 2/6; Sweet Alyssum, 1/6 to 2/-; Violas, 1/- to 2/-; Daisies, 9d. per dozen; Coltness Gem Dahlias, 2/6 to 4/- per dozen; Stocks, Asters and Antirrhinums, 6d. to 8d. per dozen; Nemesis, 1/6 and Sweet Peas 1/6 to 2/- per box.

In the fruit market the Delicious variety of New Zealand Apples averaged 18/6; Jonathan, ex fancy, 17/6, and fancy, 16/6. Prices of Blue Goose Grape Fruit advanced to 40/- per case, while Sunkist Oranges made 34/- per 176, 216 and 200 counts, 27/- to 35/- for 300's, and 28/- to 37/- for 240's. The value of Canary Bananas ranged from 17/6 to 33/-. Naples Lemons sold for 27/- to 28/-; imported white Grapes, 10/- to 12/- per tray; Apricots, 7/- per box; and Gooseberries, 3d. per lb.

Although new season's Tomatoes are becoming more plentiful, high values are well maintained. Scotch fruits sold at 1/4 to 1/6 per lb; English and Guernsey at 1/- to 1/2; and Dutch at 10/- per box. Cucumbers realised from 4/- to 7/- per dozen; Cauliflowers, 5/- to 6/- per dozen; Lettuces, 4/6 to 5/- per crate of 30; and Tenerife Potatoes, 16/6 per cwt.

## THE LATEST TRADE MARKS.

THIS list of Trade Marks, of interest to readers, has been selected from the Official Trade Marks Journal, and is published by permission of the Controller of H.M. Stationery Office.

## SOLO.

479,372.—Spraying machines for agricultural and horticultural purposes.—William James Denston, trading as Thomas Denston and Son, 21, Masshouse Lane, Birmingham. May 18.

## MAK SICCAR.

478,684.—Weed killer (chemical).—James Macneil and Sloan, Limited, 38, French Street, Bridgeton, Glasgow. May 11.

## CENTIM.

176,133.—Substances used as food are as ingredients in food which includes fruits.—Montgomery and Company, Limited, Bermaline Bakery, Fairley Street, Ibrox, Glasgow. May 11.

## FAIRYBELLE.

477,446.—Chemical substances used for agricultural, horticultural and veterinary and sanitary purposes, but not including soap or manures, and not including any goods of a like kind to any of these excluded goods.—Herbert Temple, 145, Cheapside, London, E.C.2.

## GARDENING APPOINTMENT.

Mr. S. Capon, for the past two years gardener to the EARL OF PEMBROKE, Wilton Park, Salisbury, as gardener to His Grace the DUKE OF RICHMOND and GORDON, Goodwood, Chichester. (Thanks for 2/6 for R.G.O.F. Box.—EDS.).

## SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their Advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

### PRIVATE.

**WANTED, HEAD WORKING GARDENER** of three, unmarried, good references essential.—Write, D. T., c/o Streets, 6, Gracechurch Street, E.C.3.

**WANTED, for Brentwood, WORKING HEAD GARDENER**, five in garden; married, no young children; 35-40; keen worker, good organiser, thoroughly experienced Inside and Out; Peaches, Grapes, Carnations able to grow surplus produce for sale. Cottage and garden provided.—Write, stating age, wages, experience. Essex, Box 11, 5, Tavistock Street, Covent Garden, W.C.2.

**WANTED, Good HEAD WORKING GARDENER and Wife COOK-GENERAL**, to take entire charge modernised country house near Godalming. All found, extra labour for garden.—State experience and wages required.—Reply to ORPINGTON NURSERIES COMPANY, Orpington, Kent.

**A MATEUR**, receiving new plants and seeds of alpine species from all parts of the world requires the services of a young, skilled **CULTIVATOR and PROPAGATOR**.—Apply, stating experience and salary, to B. P. G., Box 2, 5, Tavistock Street, Covent Garden, W.C.2.

**GARDENER, SINGLE-HANDED**, strong and energetic, wanted for Norfolk; Wife to help in house occasionally (no children). State experience, age, height.—Apply, M. S., c/o W. H. Smith & Son, Railway Bookstall, Thetford, Norfolk.

**WANTED, experienced GARDENER**, single, knowledge of poultry; sleep in, all found, 25/- to 30/- a week; age 28 to 40.—MRS. HUTCHINGS, The Orchard, Dulwich Common, London.

**IMMEDIATE vacancy for GIRL PUPIL**.—Apply, MISSES BERGNE and HALEY, Cottage Nurseries, Harpenden, Herts.

# SITUATIONS WANTED

Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this reduced rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.

## SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter, or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.

## PRIVATE.

**GARDENER, or GARDENER-BAILIFF**—Mrs. Fitzhugh highly recommends her Head Gardener as above; life experience, 10 years present situation; age 46.—E. SLADE, Plas Power Gardens, Wrexham.

## Orchids, Grapes, Dahlias—All flourishing beneath the protection of a Glass House

**J**ust think what a Glass House  
will do! It can transform your  
garden into a veritable flower  
show. It can cultivate luscious fruits  
otherwise impossible to grow. No  
mean advantages surely!

The art of building a good Glass  
House is not an easy one. You  
would do well to consult special-  
ists who understand the work in  
all its intricacies—William Duncan  
Tucker & Sons Ltd.

A hundred years' experience of  
skilful craftsmanship are at your  
command. Result: a Duncan  
Tucker Glass House is inevitably  
a safe and distinctive structure.

## ADVERTISE BOLDLY!

# RHODODENDRONS FOR EVERYONE

By **F. KINGDON WARD.**

**PRICE - 3s. 9d. - POST FREE.**

This fascinating work, published in 1926, has already proved exceedingly popular, and is rapidly commending itself to the gardening public, many of whose members are finding how much easier is the cultivation of these delightful flowering shrubs than they had imagined. There are very few gardens where they will not grow and flourish with ordinary, common-sense treatment, and their glorious blossoms are a perpetual feast to the eye. Capt. Kingdon Ward writes with authority, for he knows his subject at first hand, having had seven or eight years' experience of travelling in China and Tibet, where he discovered a number of new Rhododendron species.

Send for a copy to-day, to:

**THE GARDENERS' CHRONICLE, LTD.**, 5, Tavistock Street, London, W.C. 2.

## BINDING CASES FOR THE GARDENERS' CHRONICLE

We are now in a position to supply our readers with artistic green gilt lettered binders to take a half-yearly volume (twenty-six copies) of the paper.

The special advantage of this binder is that EACH COPY CAN BE BOUND IN THE CASE AS RECEIVED; thus the copies do not lie about getting dirty or perhaps mislaid, while waiting to be bound.

The binders are not sent on approval, but can be seen in use at the GARDENERS' CHRONICLE office.

Price 5/- or post free 5/6

## "ROOT & STEM VEGETABLES"

By the late Alex. Dean, V.M.H.

PRICE 3/- Post Free.

ONE of the famous "Present-Day Gardening" series, edited by the late R. Hooper Pearson, containing eight lovely coloured plates. Only a few of these books now remain, and they are not being reprinted, so that the opportunity of securing one may not be available much longer..

**GARDENERS' CHRONICLE, LTD.**  
5, Tavistock Street, Covent Garden, W.C. 2

# FERNS AND FERN CULTURE

By J. BIRKENHEAD.

Revised by F. Parsons.

PRICE 1/4 POST FREE

Ferns ought to play a much larger rôle than they do in the English garden. There are so many places where, in consequence of shade cast by tall trees or high walls, flowers needing sunshine will not thrive, and where Ferns, on the contrary, would luxuriate, given only sufficient moisture.

Ferns have a grace and dignity all their own, and can redeem by their beauty what would otherwise be a bare and unattractive corner of the garden. Those wishing to cultivate them cannot do better than purchase the little book whose title appears above.

It can be obtained from :

**THE GARDENERS' CHRONICLE LTD., 5, TAVISTOCK STREET, LONDON, W.C.2.**

**NICOTINE INSECTICIDES**

Are by far the most efficient and economical for destroying sucking insects in Greenhouse, Orchard, or Garden. I pack in pure Nicotine 95-98%, Nico-Soap (Nicotine and Soft Soap) and Fumigating forms.

**CAMPBELL'S****PATENT SULPHUR VAPORISER**

For vaporising Sulphur. The best method of destroying Mildew on Roses, Vines, etc., in Glasshouses.

Full particulars from:

**J. D. CAMPBELL**, Nicotine Manufacturer,  
7, Lund St., Cornbrook, Manchester

**ORCHIDS.**

Clean, well grown and cheap; also  
Many Rare and Choice Varieties

STOVE AND GREENHOUSE PLANTS OF ALL KINDS

Kindly send for Catalogue.

**JAMES CYPHER & SONS**

Exotic Nurseries, CHELTENHAM.

**A CLEVER INVENTION FOR RAISING WELL WATER**

The Boulton Water Elevator lifts a continuous stream of water from wells of any depth. No pipes no valves or suckers—cannot freeze. Can be fixed within an hour without skilled labour. Thousands in daily use.

Write for Catalogue No. 756.  
Boulton & Paul, Ltd. Norwich.

**COLOUR PLANNING OF THE GARDEN**

By **G. F. Tinley** and others, with an  
introduction by **Miss Gertrude Jekyll**.

FIFTY COLOURED PLATES

Price 42/- net (plus postage 1/-)

In this unique volume, three hundred lovely flowers are grouped and illustrated in their own natural colours, and thousands of other plants are fully described for the benefit of all who wish to have a garden of their favourite hue.

Take early advantage. Orders per return carriage paid.  
**H. BROWN & SONS**, Brown St. Blackburn.

**CALENDAR OF GARDEN OPERATIONS**

The CALENDAR OF GARDEN OPERATIONS is indispensable and unrivalled, because it represents the accumulated experience of over half-a-century. Originally compiled by Sir Joseph Paxton, it has been revised and enlarged by the staff of 'The Gardeners' Chronicle' until it is now as nearly perfect a gardening guide as any that exists. Its claim to be a 'calendar' is undoubted, as the work to be done is arranged under the heading of each month. It contains also many articles on subjects of horticultural and allied interest, and innumerable excellent illustrations.

Price 2/6, post free 2/10.

**THE GARDENERS' CHRONICLE Ltd.**, 5, Tavistock Street, London, W.C. 2

## You Decide

Hoeing and Hand-picking are back-aching jobs and unsatisfactory in the end. Do your weeding scientifically with WEEDICIDE which does the job thoroughly by destroying the roots.

Weedicide is a powerful Arsenical preparation, and is highly commended by the Royal Horticultural Society.

**NOTE ITS HIGH CONCENTRATION** — 1 gallon (9/-) dilutes to 100 gallons water and is sufficient to treat 300/400 square yards at the low cost of 1d. per gallon.

Pint 1/9, quart 3/-, ½ gallon 5/-, 1 gallon 9/-, 2 gallons 17/-, 5 gallons 36/6, 20 gallons 105/-, 40 gallons 200/-

OF ALL CHEMISTS.

# COOPER'S WEEDICIDE KILLS WEEDS

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 58.9°.

## ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, June 8, 10 a.m. Bar. 30.1. Temp. 53°. Weather, Dull.

On the  
Cultivation of  
Strawberries.

It goes without saying that good cultivation of any plant must depend on an understanding of the habit of growth of that plant. For without that understanding the timing of all those operations which constitute good cultivation is likely to be at fault; and bad timing is as fatal to successful results in gardening as it is in golf. It was, no doubt, the recognition of this elementary truth that led Messrs. Mann and Bell\* to undertake observations at the Long Ashton Horticultural Research Station on the growth behaviour of the Strawberry. According to these observations—which, however, are not yet complete in all respects—transplanting of well-rooted runners is followed by a certain amount of root injury which, however, is rapidly made good during the weeks of autumn following on trans-plantation. Active root growth continues until about mid-December, after which a dormant period follows which lasts until the beginning of March. In this period of spring growth it is the shoot rather than

\* Studies in the Root and Shoot Growth of the Strawberry, L. Journal of Pomology and Horticultural Science, V., 3 July, 1926.

the root which grows vigorously. Root growth in spring is, on the contrary, by no means vigorous—few new primary roots are formed at that season. Then, after cropping, the Strawberry shows a third phase of growth in which both root and shoot take equal and large part. During this phase, which lasts till mid-September, new crowns are formed, and the bulk of the plant is greatly increased. The growth of the root begins during this phase at the end of June, and is at first slow, but becomes very rapid at the beginning of August. This root growth includes the production of both new primary roots and of new lateral growth on the old roots. It is particularly noteworthy that the new primary roots have their origin chiefly at the bases of the new crowns and above the point of origin of the older roots. As might be expected, removal of blossom increases the vigour of this summer growth. When spring-planting is practised instead of autumn-planting, the Strawberry gives its attention primarily to the production of lateral feeding roots, but later, in July, new primary roots are also formed and growth of shoot as well as root goes on during August and September, with the result that spring-planted Strawberries have by that time largely caught up with those planted in the previous autumn. Several practical conclusions follow from these observations. If root growth, which forms the basis of next year's plants, begins about a month after the crop has been taken, the ground under Strawberries should be cleared and cultivated in that interval. Furthermore, inasmuch as the new roots which are formed during summer arise above the level of the old ones, it must be good practice—as many gardeners know—to draw up enough soil about the crowns to encourage and protect the young roots which are about to push out. A third conclusion would seem to be no less sound, and that is that a fertiliser likely to encourage root development as well as shoot development should be applied before the "earthing up" of the crowns is done. A suitable fertiliser would be one containing both phosphates for root growth and nitrogen for shoot growth—say super-phosphate and sulphate of ammonia. This last question, however, is one which the authors propose to investigate in the near future. It would be interesting if they were to try the effects of ammonium phosphate—a fertiliser which, although it may be for the moment difficult to come by, is likely to prove of very great value in garden practice. One other point is, perhaps, worth making. Plants, no less than human beings, like seasonal rests, and therefore it would probably be best to delay the actual clearing and cultivation of the Strawberry plot for two or three weeks after cropping so as not to rob the Strawberry of its—as it may be hoped—well-earned month's summer holiday from the work of growing.

**Honours for British Horticulturists.**—The King's list of Birthday Honours contains the names of some prominent horticulturists. Both Mr. William Lobjoit, O.B.E., late Controller of Horticulture, and Alderman James Benjamin Slade, J.P., of Messrs. Protheroe and Morris, have been made Knights; the Rt. Hon. Lord Lambourne, C.V.O., President of the Royal Horticultural Society, has been made G.C.V.O.; Mr. Thomas Hay, V.M.H., Superintendent of Hyde Park, has been made M.V.O., and Mr. George Monro, M.B.E., of Messrs. George Monro, Ltd., Covent Garden, has been made C.B.E. We offer the hearty congratulations of ourselves and our readers to these gentlemen on the distinctions awarded them.

**Kelway Challenge Trophy and Medal for Gladioli.**—The Kelway Challenge Trophy and Medal (Fig. 204) is offered annually at the British Gladiolus Society's Show for an exhibit of British Gladioli. The conditions for the award are as follows:—Thirty-six spikes of Gladioli, staged three in a vase. No restrictions as to number of varieties or spikes of a sort, but all must be of British origin, and purchased only from a British firm; British origin to mean raised, distributed or catalogued by a British amateur, and/or professional, and/or commercial horticulturist. Any variety or species of Gladiolus is eligible (from whatever section), and the name of the section need not be given. The first prize is the Kelway Silver Challenge Trophy, presented by Messrs. Kelway and Son, Langport, in commemoration of the pioneer work of the late James Kelway amongst Gladioli, to be won three times in all by the same competitor before becoming his or her property, and the Kelway Silver Medal; second prize, one guinea (also given by Messrs. Kelway and Son); third prize, Bronze Medal. Full particulars may be had on application to Mr. A. E. Amos, Hon. Secretary, The British Gladiolus Society, 10, Bergholt Road, Colchester.

**Gardeners' Club.**—The annual dinner of the Gardeners' Club was held at the Clarendon Restaurant, Hammersmith, on May 25, when a large number of members attended, and a very pleasant evening was spent. The annual meeting preceded the dinner, when the following officials were elected:—Chairman, Mr. C. P. Raffill, Royal Botanic Gardens, Kew; Vice-Chairman, Mr. J. G. Weston, Chatsworth Gardens, Bakewell; Treasurer and Secretary, Mr. F. C. Puddle, Bodnant Gardens, North Wales; Committee, Messrs. A. Bedford, Exbury; A. Bullock, Copped Hall; J. Comber, Nymans Park; T. Hay, Hyde Park; F. Jordan, Ford Manor; T. Pateman, Brocket Hall; and D. Wilmshurst, Swanley College.

**The King's Birthday Gift.**—We are interested to note that on the occasion of his birthday, the King has granted to the National Playing Fields Association the use of two of the paddocks in Bushey Park, Hampton Court, for playing fields for boys and girls. The ground, about six acres in extent, is situated at the Kingston end of Bushey Park and will be laid out for organised and other games. When making the gift the King expressed his great interest in the movement, which he hoped would be attended with success.

**Bristol's Banana Trade.**—When welcoming the annual conference of the United Commercial Travellers' Association of Great Britain and Ireland to Bristol on Monday last, the Mayor, Alderman Dyer, said that, last year, 7,000,000 bunches of Bananas, averaging 100 fruits to a bunch, were unloaded at the port of Bristol.

**A Tour of the Mid-Kent Fruit Plantations.**—Some two hundred fruit growers from all parts of the country recently completed a three day's tour of the fruit plantations of mid-Kent. The itinerary was arranged by the National Fruit Farmers Union, and the outing is the fifth of its kind. Visits in previous years have been made to Cambridge, Wisbech, Herefordshire and Worcestershire, East Kent and Norfolk. The Royal Pavilion Hotel, Folkestone, was the headquarters for the tour, and a special train to Maidstone was provided each day for the delegates to take up their programme. According to Mr. N. B. Bagenal, Horticultural Advisory Officer to the Kent County Council, whilst Hops have been grown for a long number of years and have always been regarded as a highly specialised industry, the production of fruit until comparatively recent times was not a matter of care and research. With the decline of the Hop industry at the end of the nineteenth century, the fruit industry of Kent entered on a new and rapid stage of development, and during the last fifty years the acreage has increased to a remarkable extent. In 1891, there were 20,130 acres of orchards, and 18,061 acres under small fruit in the county. By 1925, while the acreage of small fruits had declined slightly, that of orchards had increased to 53,844 acres. Of a total of 306,433 acres

devoted to fruit-growing in England and Wales, 71,230 are in Kent. On Tuesday, May 31, the party visited Clock House Farm, the Loddington Fruit Farm at Linton, and the Court Lodge Farm at East Peckham. Other farms visited during the tour were Mascall's Pound and Newman's Farm at Paddock Wood, Merriam's Farm at Leeds, and the Allington Farm, Maidstone. Frost did much damage to the fruit crops in Kent on the low land, but in some parts the prospects are very good, and on the higher land in the Maidstone district, Bramley's Seedling Apple promises to produce eighty per cent. of an average crop, whilst a full crop is expected of Lord Derby on the high land and sixty per cent. of the average in the lower orchards. The variety Newton Wonder was not so badly affected by frost as Bramley's Seedling. Whilst Victoria Plums have failed, the Czar variety promises to give a good yield, and Damsons two-thirds of an average crop. The crops of Black Currants and Strawberries are both much below the average owing to the frost. A visit was paid to the British Fruit Company's Station at East Peckham where grading and packing are carried out on exactly similar lines to those followed in the United States and British Columbia, but the growers' fruit is not pooled. The visitors were received at the East Malling Research Station by Mr. R. G. Hatton, the Director, where experiments in Apple-pruning and the cultivation of Black Currants were inspected and the visitors were shown the investigations which were being carried on with Apple stocks and Plum stocks.

**Honour for French Horticulturist.**—We are pleased to learn that M. Alfred Nombrot, Secretary of the French National Horticultural Society, has been awarded by the Dutch Government the Order of Orange-Nassau, with the grade of Commander, in recognition of his services in connection with the Centenary Show held at Paris recently, in which the Dutch growers largely participated. We may state that this honour is very much coveted, being granted very sparingly, and we congratulate M. Nombrot warmly on this distinction, which his arduous and successful labours in connection with the exhibition have obtained him.

**Horticultural Education Association.**—According to the twenty-first annual report of this Association, the members of which are engaged in horticultural education and research, the membership is now more than 130, and includes representatives of practically every county in England, Wales and Scotland, as well as one member in Northern Ireland. The President for the year 1926-1927 is Mr. A. Burgess, Horticultural Superintendent under the Surrey Education Committee. Mr. A. Simmons, Honorary Secretary of the Association, having resigned this office, Mr. W. H. Neild, Long Ashton, was elected to the vacancy. The balance sheet shows a balance in hand of over £50.

**Fruit Competitions for Amateurs.**—The Royal Horticultural Society has arranged two competitions for fruits, open only to amateurs, to be held on July 19 and August 3, in conjunction with the fortnightly meetings on these dates, in the Vincent Square Hall, Westminster. The one on July 19 is scheduled as a Cherry and Soft Fruits Competition, and includes twenty classes for Cherries, Gooseberries, Black Currants, Red Currants, White Currants, Raspberries, Figs, Loganberries, Blackberries and other Rubi. The most important classes are those for a collection of Cherries in not fewer than six varieties, in which the first prize is the Bunyard Silver Medal and £4, the second prize the Bunyard Medal and £2, and the third, £1; for a collection of Gooseberries in not fewer than nine varieties, in which similar prizes are offered, and for a collection of twelve dishes of any of the fruits mentioned in the schedule, not fewer than six kinds, not more than four dishes of any one kind, and not more than one dish of any one variety. In this class the first prize is the Silver Hogg Medal and £6, the second the Hogg Medal and £3, and the third £2. Entries for the Cherry and Soft Fruits Competition must be sent not later than first

post on Tuesday, July 12, and for the other competition, not later than by first post on Wednesday, July 27. The competition on August 3 is for Peaches, Nectarines, Apricots, Plums, Cherries, Rubi and Apples. The Silver Bunyard Medal and £5 is offered as the first prize for a collection of Peaches and/or Nectarines in not fewer than six varieties, and a similar Medal and £4 is offered for six early varieties of cooking and/or dessert Apples, whilst the Silver Hogg Medal and £6 is offered as a first prize for a collection of twelve dishes of the fruits mentioned in the schedule. All amateurs, whether Fellows of the Society or not, unless excluded by some special regulation, are invited to compete. Copies of the schedule may be obtained from the Secretary, Royal Horticultural Society, Vincent Square, London, S.W.1.

**Sir William George Lobjoit, O.B.E.**—We offer hearty congratulations on behalf of ourselves and our readers to Sir William Lobjoit on the honour bestowed on him by the King

SIR WILLIAM GEORGE LOBJOIT, O.B.E.

in his recent Knighthood, which was awarded "for Public Services." During the time Sir William Lobjoit held the office of Controller of Horticulture at the Ministry of Agriculture he did valuable work in promoting the best interests of the country as well as of horticulture generally, and whilst the holder of an official appointment of this nature cannot hope to please all, everyone is agreed that no more suitable person could have been chosen, and the members of the trade generally recognise that he was one of their best friends. We take the opportunity to publish the portrait of Sir William Lobjoit, and to wish him every success in the future.

**Gardener Injured in a Motor Accident.**—Mr. Mathers, gardener at Mereworth Castle, Maidstone, was injured in the motor-car collision in which his employer's wife, Lady Oranmore and Browne, was killed on the 7th inst. Lord Oranmore, Lady Oranmore's lady secretary, and the chauffeur, were also injured more or less seriously.

**Sending Soft Fruits by Post.**—The postal authorities state that at this season of the year considerable quantities of Strawberries and other soft fruits are sent through the post, and many of the packages are found in the course of conveyance to have been inadequately packed, with the result that not only is the fruit damaged, but damage, for which the sender of the fruit is liable, is done to the contents of other parcels. The Postmaster-General, therefore, considers it necessary to draw the attention

of the public to the method of packing which has been found by experience to afford the best protection. The packing must be such that the juice cannot exude. A metal box with a tightly-fitting lid and securely tied with string crossing the lid in both directions should be used. No parcel will be accepted which contains soft fruit packed in a chip or wicker basket, or a cardboard box, or a tin box with a lid that is not tightly fitting. Parcels of fruit should be conspicuously marked "Fruit, with Care."

**Inspection of Growing Crops of Potatoes in Scotland.**—The Board of Agriculture for Scotland remind all Potato merchants who have not yet applied for the inspection of their Potato crops that June 18 is the last date for the receipt of applications. Particulars of the scheme were published in *Gard. Chron.*, May 28, p. 365. Any grower who desires further information on the subject should communicate without delay with the Secretary, Board of Agriculture for Scotland, York Buildings, Queen Street, Edinburgh, from whom forms of application may be obtained. Applications received after June 18 will not be accepted unless accompanied by a double fee, but no guarantee can be given that the inspection will be undertaken in such cases.

**Gardeners' Royal Benevolent Institution.**—The Festival Dinner (eighty-second anniversary) in aid of the funds of the Gardeners' Royal Benevolent Institution will take place at the New Princes' Galleries, on Wednesday, June 29, at 7.30, under the Presidency of Major-General The Lord Treowen, C.B., C.M.G. Contributions to be placed on the Chairman's subscription list are earnestly solicited, and will be gratefully received and acknowledged by the Secretary, Mr. George J. Ingram, at the offices, 92, Victoria Street, S.W.1.

**Dutch Fruits and Vegetables.**—Mr. B. Gerritzen, Horticultural Adviser to the Netherland Legation, delivered one of the Chadwick Public Open-air Lectures at the Chelsea Physic Garden, on Tuesday, May 31. His subject was "The Growing, Marketing and Exporting of Fruit and Vegetables in the Netherlands." Mr. Gerritzen gave a short historical review of the cultivation of fruits and vegetables in the Netherlands from the Middle Ages, when it was exclusively in the hands of the monasteries and the nobility. When, however, the nobility sank into poverty in the sixteenth century, the working classes embarked on commercial horticulture and found ready markets for their produce in the growing cities and towns of Amsterdam, the Hague, Delft, Schiedam and Rotterdam. By the beginning of the nineteenth century certain horticultural districts were already in a fairly flourishing condition, and, favoured by suitable soil and climate, and being excellently situated between manufacturing countries with ever-growing populations, the Netherlands developed important centres of cultivation for the export trade where, eventually, glasshouses were erected for forcing purposes. The lecturer described a few of the leading districts where growers had specialised, notably in the Westland, where glasshouse produce and early crops were produced; and at the Langendyk, where outdoor produce, especially store Cabbage was the chief culture. By the experience gained during centuries, the Dutch growers learned their business exceptionally well, but as they had to rely more and more upon foreign markets, they had also to meet the requirements of consumers abroad. Nowadays, great attention is paid to maintaining the quality of the crops, rendering them fit for dispatch over long distances, and to grading and packing. Most of the difficulties arising had been met by a well-organised marketing system, the establishment of Dutch auctions, and at present the many—about 170—auction marts. There was a Federation of Auction Societies dealing in vegetables and fruits, and, in co-operation with exporters, a Committee for the control of export had been founded. This Committee drafted uniform regulations as to packing and grading, and could be joined by auction societies and exporters, as members, who were entitled to attach labels to the packages of produce

provided the packing is in accordance with established standards. So, by co-operation between growers and exporters, every endeavour is made to ensure that only first-class produce is sent to foreign countries. The German and British markets are of prime importance to the Netherlands, Germany receiving about fifty per cent., and Great Britain thirty-six per cent. of the produce exported. The lecturer followed with a summary of the standards fixed for the different products, and emphasised that only first quality material could be shipped under the label already referred to. Mr. Gerritzen observed that British and Continental tastes differed in regard to vegetables, and for this reason certain products could not find a market in this country. Specimens of Dutch vegetables and fruits available at this season of the year were exhibited in the packages in which they had arrived. A few maps of the Netherlands and horticultural districts were also exhibited, also numerous pictures of auctions and cultures, all very typical of the country. For those especially interested in the development of the export trade some extracts from statistics were provided in tabular form.

**Association of Economic Biologists.**—The next meeting of the Association of Economic Biologists will be held on the 17th and 18th of June, at the South Eastern Agricultural College, Wye.

**Fruit Growing in Public Open Spaces.**—While a writer in a popular weekly periodical advances, as new, the suggestion that fruit trees should be planted in our public parks and open spaces, instead of purely ornamental trees, a Paris correspondent of *The Observer* relates, in last Sunday's issue, a lamentable happening in connection with fruit-growing in public places. It seems that in one of the suburbs of Paris a park-keeper caught two boys taking Cherries from a tree in the grounds. The boys escaped capture and, from what they considered to be a safe distance, jeered at the park-keeper, who drew a revolver and fired, seriously wounding one of the boys. This could scarcely have happened in our parks, but it tends to show that, especially where fruit is growing, as "boys will be boys," fruits are not safe in public places. As many of our readers are aware, the advocacy of planting fruit trees in public grounds is no new thing, and many years ago some of our correspondents advanced arguments for and against the suggestion.

**Fire at Parkhurst Forest.**—On Whit-Sunday afternoon a fire which broke out in the undergrowth of Parkhurst Forest, Isle of Wight, quickly assumed serious proportions, and a party of convicts from the Camp Hill Prison, near by, were brought out to help beat out the flames. A detachment of the Argyll and Sutherland Highlanders from Parkhurst Barracks joined the convicts and, after several hours' hard work, the fire was subdued, but several acres of the forest were badly burned.

**Masters Memorial Lectures, 1927.**—The Masters' Memorial Lectures will be delivered on Tuesday and Wednesday, June 21 and 22, at 3 p.m., by Dr. C. H. Ostenfeld, of Copenhagen. The title of the lectures is "Some Remarks upon Hybrids between Species in Flowering Plants."

**New Species from the Andes of the Argentine.** *Kew Bulletin* No. 4, 1927, contains the descriptions of some new species collected by Mr. H. F. Comber during his expedition to the Argentine in 1925. His collection of dried specimens is being worked out at Kew by Mr. N. Y. Sandwith. Preference was given to some two hundred species which appeared to be of special horticultural interest, and of which Mr. Comber was able to obtain seeds or living vegetative material; the naming of this part of the collection has been completed. It contains a number of interesting and beautiful plants and fourteen species which proved to be new to science. We understand it is proposed to publish an annotated copy of this list at a later date, but meanwhile technical descriptions (in Latin)

of the new species have been published in the *Bulletin* under the following names:—*Berberis Comberi*, *Malvastrum corymbosum*, *Cristaria eburnea*, *Larrea simulans*, *Anarthrophyllum ornithopodum*, *Adesmia guttulifera*, *Cassia egregia*, *Chuquiragua straminea*, *Calceolaria poikilanthos*, *Argyria robusta*, *Verbena cedroides*, *V. Comberi*, *V. dolichothyrsa*, *V. spissa*.

**Appointments for the Ensuing Week.**—**MONDAY, JUNE 13:** Romsey Gardeners' Association's meeting; United Horticultural Benefit and Provident Society's meeting; Guildford and District Gardeners' Association's meeting. **TUESDAY, JUNE 14:** Jersey Gardeners' Society's meeting. **WEDNESDAY, JUNE 15:** Royal Gardeners' Orphan Fund meeting. **FRIDAY, JUNE**

obtained by following his favourite method—cutting away all old wood except what is barely necessary to furnish the young shoots annually required, and training these on the long-rod system, each rod to bear in the succeeding year, and then to be cut out at two or three eyes from its base. Notwithstanding his recommendation to "cut down" established vines, and begin *de novo*, I accommodated my vines gradually to the system and have now four successive tiers at the back of my house; that is, a succession of short horizontal branches, at the ground and at three different heights, and these furnish rods which are serpentine in their first year, and in the second year branch out right and left, amply cropped. These side branches are so nailed as to leave perpendicular intervals for

FIG. 196.—IRIS AKBAR.  
(see p. 418).

17: Association of Economic Biologists meet at the S. E. Agricultural College, Wye (two days).

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Out-door Grapes.*—Will you give a corner to the memory of Clement Hoare? So far as his work upon *The Culture of the Vine on Open Walls* is concerned, he deserves well, indeed, of his countrymen. I acknowledge myself under grateful obligation to him; and, at this season of the year, would draw the attention of all who have out-door vines to his excellent treatise. His "Weekly Calendarial Register," therein, is worded in such a manner that in whatever mode vines happen to be trained, his directions are of value, therefore all should study it; but I would particularly direct attention to the simplicity, the saving of labour, shreds and nails, and to the wonderful increase of fruit to be

the rods of the current year to occupy; each tier is six or eight feet in height. My success has been remarkable, and I have had large Black Hamburgs so well ripened that they have occasionally had quite a nuance of Frontignan flavour; and I have often thought that, like the Bicton Pines, they are a proof of what perfect ripening in the open air accomplishes. How can horticulturists be contented with stagnant warmth in their hothouses? *G. W., Gard. Chron., June 12, 1852.*

**Publications Received.**—*Honey and the Bee*, with Recipes by James Henry Cook, 121, Aston Brook Street, Birmingham; *Health from Food* Library No. 12, price 2½d. post free.—*Seeds and How to Raise Them*, by Richard Sudell, A.R.H.S., L. H. Chase, Abbey Road, Chertsey, Surrey; price 1s.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Phalaenopsis.**—These handsome Orchids commence to make new roots soon after they have finished flowering. Such species as *P. amabilis*, *P. Schilleriana*, *P. Stuartiana*, and others of this type are still in bloom, and will require attention as the flower scapes fade or are removed from the plants. A small division is often set apart for these showy Orchids, and while this is not necessary, if sufficient plants are included to allow of growing them by themselves, it is much easier to cultivate them. *Phalaenopsis* may be grown in pots, pans, baskets, cylinders, or even on blocks of wood and rafts, but pots or baskets are the best receptacles. Whichever kind is used, they should be well-drained with clean crocks, as no plant resents a sour compost more than *Phalaenopsis*. The different species and varieties vary as regards their manner of growth and their time of flowering, hence the repotting of the plants has to be done at different times of the year. Those who are fortunate enough to possess a good stock of these plants should take particular care of them, as there is a danger of them becoming extremely rare. These Orchids should have new rooting-material afforded them each year, and those growing in baskets that have become decayed should be provided with new ones. In removing the plants from the old receptacles every care should be taken not to injure the roots, which cling to the sides, and with those growing in baskets, it is often advisable to take the basket to pieces to get them out. The old material should be carefully removed from those growing in pots or pans, cutting away all decayed roots, dead root-stocks, and cleansing those that remain by immersing them in clean, tepid rain water.

**Compost.**—The compost should consist of live Sphagnum-moss and Osmunda-fibre in equal proportions, with a layer of clean heads of Sphagnum-moss over the surface. The moss should be thoroughly searched for slugs and other pests before it is used. Having finished the potting, water the plants liberally with tepid rain-water, allowing them to become dry before watering them again. The *Phalaenopsis* is very floriferous, and this is, no doubt, one cause why the plants often deteriorate; the spike should be cut soon after the last flower has opened, and those plants which have been disturbed should not be allowed to carry a flower-scape until they are thoroughly established. *Phalaenopsis* enjoy the temperature of the warmest house the whole year round; the day temperature at this season should range from 75° to 80°, according to the brightness of the weather. When the plants enter their resting season, a slightly lower temperature will suffice, and both the plants and the houses should be kept drier.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERBREE, Horsley Hall, Grestford, N. Wales.

**Seakale.**—Thin the young shoots, leaving only one strong crown to each plant; in doing this take care not to disturb the roots, as this would give a check to the plants. Keep the ground well hoed between the rows. A light dressing of salt may be given with advantage, especially on dry soils.

**Asparagus.**—Newly-planted Asparagus is growing freely, and care must be taken that the young plants do not suffer from drought. Seedlings in newly-sown beds should be thinned,

so soon as they are large enough, allowing each plant a space of about fifteen inches each way. Cutting should now be discontinued in established beds or the crowns will be weakened. Give the beds a fair dressing of salt, and feed the plants with guano two or three times during the season. During dry weather and especially on light soils, liquid manure will prove very beneficial. Keep the beds clear of weeds. Give necessary support to the growths of the plants to prevent them from being broken by strong winds.

**Peas.**—After the middle of the present month, and especially in cold, wet districts, it will not be wise to make further sowings of late varieties of Peas; but during the next few weeks sowings may be made of such sorts as Pilot, Gradus, Laxton's Superb, or any of the early varieties. Attend to the necessary staking of this crop. Keep the ground stirred with the hoe, and in dry weather mulch the rows with lawn mowings or litter, which will do much to conserve the soil moisture. Take precautionary measures to ward off attacks of thrips by damping the foliage in the evenings of hot days with weak soot water, also by spraying the plants occasionally with Quassia extract, or anything which would make the foliage distasteful.

**Spinach.**—Maintain a succession of this vegetable by sowing at least every fortnight. Should the weather be very dry, soak the soil in the drills before sowing the seeds. Make further sowings of New Zealand Spinach. This crop will prove very useful, especially on soils where ordinary Spinach runs to seed quickly.

**Coleworts.**—Seeds of Coleworts should be sown to produce plants for early supplies, and again later for late autumn use.

**Carrots.**—Make small sowings of Carrots on frequent occasions where they are required to supply roots in a very small stage.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Strawberries in Pots.**—Only young, vigorous plants are capable of producing good runners early in the season; maiden plants put out last August and divested of all their flowers will give an abundance of runners in June and early July. To have good plants with ripe crowns suitable for starting in November and December the runners should be layered so soon as they are available. These may either be layered direct in five-inch pots or in sixty-sized pots; if the larger size is used they should be clean, dry, and filled with suitable compost. Strawberries will grow in almost any free, rich soil made pervious to the free passage of water by the addition of old lime rubble, bone meal, pounded oyster shells or a little charcoal, according to the texture of the soil. As the compost needs to be made very firm by ramming, it must be used on the dry side, and will be in a suitable condition for use if it is prepared a few weeks before it is wanted. When the runners are placed direct in the pots in which they will fruit, the crowns should be above the surface of the soil, their natural position, and will become red and hard before autumn. Such crowns invariably throw fine trusses of bloom and give good results. Watering is a very important detail of cultivation as the pots soon become filled with roots. Weak liquid manure is of great benefit to the plants from the time they are potted until they show signs of ripening. Later kinds, which ripen their fruits when bright sun and drying winds prevail, should have larger pots, and the compost may be a little heavier in texture, as the roots will penetrate the hardest compost, when they are in a healthy condition. The pots do not require a large amount of drainage material, but the crocks should be clean and well-placed. Opinions vary as to the value of overhead watering in hot, dry weather, but unless the water is

soft and warm, the less moisture is cast over the leaves, the better; summer showers are beneficial.

**Compost.**—If a good supply of loam has not been secured, turf from an old pasture should be cut and stacked. As the material is placed in layers, dust it liberally with soot, which is a good deterrent to wireworms. Burnt earth may be added to heavy loams, whilst marl and old cow-manure are beneficial to light, sandy soils. Strong liquid manure may be poured on the latter with excellent results, in fact, any loam carted in a dry state may be watered freely with liquid manure before it is stacked. The compost may then be chopped down as wanted, and should lie exposed to the sun and air until it is dry and warm.

### THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Violas.**—If Violas are expected to furnish a display of bright flowers throughout the summer they will require a good deal of attention, especially in the south, where hot, dry weather often proves very trying to them. Under such conditions frequent top-dressings and waterings are essential; in the north, where cooler and moister conditions obtain, Violas are not so much trouble to maintain in good condition. Where they are required for a spring display the stock should now be raised either from cuttings inserted in cold frames, or by division of the old plants and putting the portions in the reserve garden. Although young plants are smaller and require closer planting, they usually winter better than older ones, especially on heavy, wet soils.

**Lunaria biennis (Honesty).**—This old-fashioned plant is very charming in wild or semi-wild parts of the garden, and it is surprising it is not more generally grown, not only for its fragrant purple flowers, but also for the silvery, flat seed-pods that succeed them. The white-flowered variety is very beautiful when grown against a dark background of Yew, or some other dark evergreen. Although *Honesty* may be sown in the nursery garden and the young plants transferred to their flowering positions, it is best to sow the seeds where the plants will flower; they should be sown in irregular drifts, in as natural a manner as possible, and in suitable conditions; there is no reason why this plant should not become naturalised. The present is a suitable time to sow the seeds.

**Hesperis matronalis.**—This old-fashioned, fragrant flower is also deserving of more general cultivation; it is, perhaps, seen at its best when naturalised in shrubberies or in shady places in thin woodland. It is a perennial, but a stock may easily be raised from seeds, which may be sown at this time in the reserve garden. There are several double varieties, although some of them have, I am afraid, disappeared from cultivation, the white-flowered variety being the most common. Well-grown plants attain a height of three feet and are very beautiful, producing long spikes of fragrant, Stock-like flowers. The double Rockets have always, and not without reason, been regarded as difficult subjects to cultivate, and especially in the south. In the north and cooler parts of the country they may be more easily grown. It is necessary to propagate young stock every year; after the plants have flowered the shoots should be partially shortened, and when young growths have started from the base the plants may be lifted and divided, planting them in the reserve garden until the autumn. Another method of raising stock is to make cuttings from the side-shoots, and insert them in a cold frame, or even out-of-doors, as they will root readily if kept shaded. The best of all methods of increase is to keep a stock of plants specially for propagation, not allowing them to flower; these plants will develop plenty of young shoots suitable for use as cuttings early in the season.

## PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to HER CHARLES NALL-CAIN,  
Brocket Hall, Hertfordshire.

**Souvenir de la Malmaison Carnations.**—After the flowers have been cut from these plants the latter may be removed to a cold frame and allowed to remain a while before the operation of layering takes place. Should the weather prove hot and dry, it will be necessary to shade the plants from bright sunshine. Layers are best obtained from young plants that have been grown for one season only. Those that are to be potted on to grow into large specimens may receive this attention so soon as it is convenient. After potting the plants, water should be given the roots sparingly, but at the same time never allow them to suffer from lack of moisture. Spraying the plants with soft water during hot, dry weather will help them to become re-established under more favourable conditions. Although there are numbers of varieties, the best are probably Duchess of Westminster, Old Blush and Princess of Wales, and if only a small collection is grown it will be found difficult to surpass these three sorts.

**Calceolarias.**—Seeds of herbaceous Calceolarias may be sown now to obtain flowering plants early next spring, and a second sowing may be made in July for a later batch. The receptacles should be filled with a light, open compost, which should be watered with a fine rose can several hours before sowing the seeds, which are small and need to be sown on a fine, even surface. It is not necessary to cover the seeds with soil; the surface may receive a light sprinkling of fine silver sand. Cover the seed-pans with a sheet of glass and stand them in a cool greenhouse, keeping their surroundings moist and the soil shaded from bright sunshine. Calceolaria seeds germinate very quickly, therefore watch the pan carefully and remove the glass immediately the seedlings appear. At this stage, great care is needed, for the tiny seedlings must never lack moisture or they would dry up and die off quickly. The seedlings should be pricked off immediately they can be handled in a light, open compost and stood in a frame or greenhouse facing north-east, where little shading will be necessary. Greenfly is somewhat troublesome to this plant and must be rigorously suppressed by spraying the plants on frequent occasions with a suitable insecticide.

**Salvia splendens and S. leucantha.**—Plants of these Sages that are intended to be grown as large specimens should be ready for placing in the pots in which they are to flower. The soil may consist chiefly of good loam mixed with old Mushroom-bed manure and a dash of bone-meal, with sharp grit added to render the texture porous. Place the plants in a cold frame until they have become established in the new compost when they may be stood out-of-doors, for preference in a place shaded from mid-day sun. Red spider attacks these Salvias, but syringing the plants in the evenings with clear water will keep this pest in check.

## HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Gooseberries.**—To obtain large dessert berries of the best quality the bushes should not be cropped too heavily, while the foliage should be kept clean and free from red spider and other insect pests. Bushes that are cropping heavily should be thinned severely of the fruits. The green berries removed may be used for tarts or for bottling; if for the latter purpose they should be of an even size. If the bushes are growing on light land a liberal mulching of decayed manure over the roots, followed by a soaking of water or liquid manure at intervals in dry weather will prove exceptionally beneficial to the crop.

**Fig Trees.**—These trees are growing freely and are well studded with young fruits. As the new growths extend, such as are required for furnishing the space or for fruiting next year should be secured in position. Suitable shoots may be tied over the older branches at intervals

and others fastened to the walls or wires. Thin the shoots, if necessary, to prevent overcrowding, but do not stop any of the leading growths of those that are required for fruiting next season.

**Loganberries.**—Where Loganberries are planted in good soil the growths are usually strong and numerous. Their number should be reduced at an early stage, retaining only sufficient for filling the available space and to take the places later of those that have fruited. In some soils the Loganberry grows and crops well without much help at the roots, but where the land is porous and light, mulchings of manure and repeated waterings with liquid manure

south walls out-of-doors the fruits of the first crop are swelling, and the same procedure is recommended as above, although these trees will require longer time to perfect their fruits, but they form a most valuable succession where Figs succeed in these conditions, extending the season until late September. Young Fig trees are often disappointing if allowed a free root-run, and succeed better if only given a limited space at first, enlarging the border as becomes necessary.

**Thinning Grapes.**—Late varieties of Grapes and those grown in cold houses are now ready for thinning, and every opportunity must be taken to get this important work completed

FIG. 197.—WEINMANNIA TRICHOSPERMA.

R.H.S. Award of Merit, May 25. Flowers white, with pink-tipped anthers.

Shown by Mr. Gerald Loder. (see p. 376).

are essential to obtain good results. Loganberries are useful for many purposes and should be gathered before the seeds become hard.

## FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF  
AILSA, Culzean Castle, Maybole, Ayrshire

**Figs.**—The first crop of Figs in heated houses is now over, and if the tips of the growing shoots have been stopped regularly, the second crop of fruits should be swelling rapidly. At this stage the trees must never be allowed to suffer for lack of moisture at the roots, and frequent applications of diluted liquid manure are of great assistance in maintaining vigour and promoting the swelling of the fruits. Remove all superfluous growths and keep the young shoots tied so that no part of the trees become overcrowded, and thus prevent the sunlight from reaching the fruits. In cold houses and on

before the berries become tightly wedged in the bunches, as they are then much more difficult to thin, and the work is correspondingly slower; moreover, when the berries are crowded there is a danger of injury in thinning them. The chief objection to growing several houses of Grapes entirely without fire-heat is that they usually develop uniformly, and all require attention at the same time. The laterals and sub-laterals should be kept well under control by stopping the latter at the second or third leaf and not allowing them to grow too vigorously and draw the sap from the bunches. The main shoots, or leaders, may be allowed to extend until the thinning has been completed, when they should be stopped by pinching out the growing points. So soon as the thinning has been completed a top-dressing of an approved vine manure should be applied and well-watered in, and a good layer of farm-yard manure spread over the borders to conserve moisture, and also to act as a stimulant at future waterings.

## ROSE GARDEN.

## SOME OLD-TIME ROSES.

REFERENCE to the Roses exhibited in pots at the Royal Botanic Society's meeting on May 10, 1848, will perhaps recall happy memories to old rosarians. The report runs:—"Concerning Roses in pots, too much can hardly be said, for seldom have we seen better collections. The flowers were large and fine and the foliage clean and healthy. The varieties exhibited by Messrs. Lane, Messrs. Paul and Mr. Francois (of Hertford) included Duchess of Sutherland, Louis Bonaparte, Baronne Prevost, Arnosa, Mrs. Elliot, Auberon, Adam, Grand Capitaine, Lane, Duc de Chartres, Miellet, Lady Alice Peel, Cels multiflora, Comte de Paris, Mrs. Bosanquet, Madame Laffay, Paul Perras, Madame Lacharme, William Jesse, Taglioni, Souvenir de la Malmaison, Triptoleme, Coupe d'Hebe, Goubalt, Bouquet de Flore, General Allard, Felicite, Eugene Beauharnais, Comte d'Eu, Augustine Mouchelet, Princess Helen, Caroline and Fabvier.

In a special class for yellow Roses, Mr. Lane secured the premier award with *Venusta*, *Banksia*, *Harrisonii*, *Nisida*, *Solfaterre* and *Vicomtesse de Cazes*."

The grand old *Souvenir de la Malmaison* is even now beloved of discriminating gardeners, and the yellow *Harrisonii* is not infrequent in gardens, but the majority of the others have long since disappeared. Many of them, however, retained their popularity for several years subsequent to 1848, and their names will enable old rosarians to visualise from memory the hopes and fears, the victories and defeats of bygone shows.

In the *Floricultural Cabinet* for 1848, Mr. Rivers gives the best twelve H.P. Roses as follows: Auberon, crimson; Augustine Mouchelet, brilliant red; Baronne Prevost, bright red; Countess Duchatel, bright rose; Dr. Marx, brilliant red; Duc d'Aumale, brilliant crimson; Duchess of Sutherland, handsome rose colour; Lady Alice Peel, deep pink; La Reine, brilliant, glossy rose colour; Madame Laffay, rosy crimson; Marquis Binella, pale flesh, and Robin Hood, bright pink.

In the same article appears the following interesting passage: "It is only in cases where it is wished for the qualities of a particular Rose to predominate that the removal of the anthers of the Rose to be fertilised, is necessary. Thus, if a yellow climbing Rose is desired, by the union of the yellow Briar with the Ayshire, every anther should be removed from the latter, so that it is fertilised wholly with the pollen of the former. In some cases, where it is desirable to have the qualities of both parents in an equal degree, the removal of the anthers must not take place. Thus I have found, by removing them from the Luxembourg Moss, and fertilising that Rose with a variety of *Rose gallica*, that the features of the Moss Rose are totally lost in its offspring (the seedlings) and they become nearly pure varieties of the former; but if the anthers of the Moss Rose are left untouched, and it is fertilised with *Rosa gallica*, interesting hybrids are the result, more or less mossy."

This passage should be full of interest, if only from the fact that it is the written word of a gentleman who will for ever occupy a foremost position in British Rose history.

The 'seventies and 'eighties witnessed the advent of very many grand Roses, and it is particularly interesting to realise how few now remain; some outstanding varieties of that period were: Hybrid Perpetuals—Abel Grand, silvery rose; General Jacqueminot, crimson-scarlet; Alfred Colomb, fiery red; Beauty of Waltham, rosy-crimson; Captain Christy, soft flesh; Duchesse de Vallambrosa, soft rose, bright pink centre, passing to white; Duke of Edinburgh, fine vermilion; Duke of Teck, crimson-scarlet; Duke of Wellington, bright crimson; Fisher Holmes, rich crimson; John Hopper, deep rose; La France, rose; Louis Van Houtte, reddish-scarlet, shaded; Prince Camille de Rohan, crimson-maroon; Paul Neron, deep rose; Star of Waltham, rosy crimson, and Ulrich Brunner, carmine-rose. The Teas included Catherine Mermet, flesh

pink; Madame Berard, salmon-yellow; Madame de Watteville, white, shaded salmon; Madame Lambard, red; Perle des Jardins, orange-yellow; Souvenir d'Un Ami, deep rose and Madame Margottin, citron-yellow.

Many in this necessarily abbreviated list are still grown, others have passed out of cultivation; it is, however, an abiding joy to know that *Maréchal Niel* may even now win in its class, and that it, with such other old favourites as *Gloire de Dijon* and *Niphetos*, may long remain with us, worthy survivals of a past generation, and a glorious incentive to another.

Space will not permit of reference to hosts of other good Roses, but I cannot refrain from a passing thought of *Cloth of Gold*, that finest of all yellow Roses and the despair of every grower.

The Hybrid Teas of an earlier generation, such as *Beauty of Stapleford*, pink; Countess of Pembroke, satin-rose; Lady Mary Fitzwilliam, flesh; Nancy Lee, soft rose, and Pearl, flesh-white, are now almost forgotten; another *Noisette*, William Allen Richardson, is, like *Maréchal Niel*, ever with us, and the very name is redolent of an old-world garden in June. *Ralph E. Arnold*.

## ALPINE GARDEN.

## RANUNCULUS GRAMINEUS.

THIS is an attractive little plant of easy culture, suitable for a cool position on the rock garden.

Though by no means common, it has long been cultivated. It is mentioned by Parkinson in his *Paradisus in Sole*, in which work a double form is figured, though this does not seem to be in existence now. Free of growth, it has glaucous, lanceolate or linear leaves, with entire margins, and of a blue-grey colour.

The large flowers, borne on erect, slender stems, from six inches to twelve inches high, are of a glossy, clear, rich orange-yellow, and when produced abundantly, make a pleasing display. The species is figured in one of the early volumes of the *Bot. Mag.*, t. 164, and is a native of southern France and Italy. On the rock garden it should be planted in loamy soil in a cool, moderately sunny position. *A. G. F.*

## GERANIUM ARGENTEUM.

THIS Geranium is one of the choicest members of its family for the rock garden. The silvery leaves are pleasing in outline and very beautiful generally; the flowers, an inch or more across, are of the palest shade of pink with a delicate network of very fine rose markings.

The plant grows well in the moraine; in fact, when not growing in a moraine it would seem that its lightness of habit demanded the placing of a thin layer of granite chippings on the surface of the pocket accorded it, in order to prevent the leaves and flowers from being splashed with soil. *W. H.*

## DIANTHUS SQUARROSUS.

THIS delightful little Pink, of dwarf, tufted habit, enjoys a sunny, well-drained position in the rock garden, where it never fails to attract attention with its heavily fringed, pure white flowers and typical grey foliage.

The plant rarely exceeds three inches in height and forms a close cushion. It is a very old plant in gardens; it was introduced from Southern Russia in 1817. As with the majority of its congeners, *D. squarrosus* is readily propagated from cuttings. *Ralph E. Arnold*.

## PHLOX SUBULATA × P. AMOENA.

As an admirer for many years of the dwarf Phloxes of the type of *P. subulata* or *P. setacea*, I was pleased to receive as an acquisition to my new garden a plant bearing the above name. I am not aware if it has another or varietal name, but it is desirable that it should have one.

The plant is an acquisition from the fact that it has larger flowers than most of the varieties of *P. subulata*; they are of a bright purple and quite effective in the rock garden.

The foliage resembles that of *P. subulata*, but the flowers come more nearly to *P. amoena*. *S. Arnold*.

## RANUNCULUS LYALLII IN NEW ZEALAND.

We are indebted to Mr. David Tannock, Superintendent of the Public Gardens, Reserves and Plantations of New Zealand, for the photograph of *Ranunculus Lyallii* growing in the Dunedin Botanical Gardens and reproduced in the Supplementary Illustration of this issue. Mr. Tannock states that "the plants were obtained from the Mount Cook district, when they were at rest, in 1925, and planted in the raised border, as shown in the illustration, the soil of which was previously well trenched. The soil is mainly organic matter, from nine inches to one foot deep, overlying friable clay. Though on the hillside, this part of the gardens is never dry, and for the greater part of the year water soaking from the higher parts maintains a supply of moisture in the sub-soil. The Mountain Lily is usually found wild beside a stream, or in hollow where there is an abundance of moisture as well as excellent drainage, the material in which it is growing being mainly organic matter and stone chips. Previously we grew this plant indifferently in a moist position on the rock garden, and we also tried it beside a stream in the Rhododendron dell, but nowhere has it thriven so well as on the raised border. Last year there was a number of flowers and good foliage; this year there was an abundance of flowers and better foliage, which promises well for the future. We have collected all the seeds and are sending them to Kew and other gardens at home, and I feel certain that once this plant is established it will be appreciated, for it is certainly the finest Buttercup I know. We have also abandoned the rock-garden method of growing *Celmisias*, *Veronicas* and other native mountain plants, finding the raised border simpler, less expensive and more satisfactory."

## FLORISTS' FLOWERS.

## AURICULAS AT NETHER WARDEN.

In years gone by, when the cultivation of Auriculas was a prominent feature of horticulture, the northern cultivators of these plants could generally hold their own at the numerous spring flower shows, where special classes were provided for the different sections of these plants.

These exhibitions were brought vividly to my mind on entering a house devoted to the culture of Auriculas entirely in the gardens of Clive Cookson, Esq., at Nether Warden, Hexham, Northumberland. There were hundreds of plants in flower, from the classic Fancies to the humble seedlings of the alpine section, and even included plants of the original *Primula Auricula*.

The cool, moist conditions of the atmosphere in the north was stated years ago to be specially suited to these plants, but whether such is the case or not, I have never seen larger flowers, so finely developed in colour, or of greater substance, than were seen on the occasion of my visit.

Of the show section, I noted plants with large trusses of such varieties as Dr. Kidd, Splendour, Green Lady, Lorna Doon, Scarlet King, Royal Purple, Dusky Queen, Sapphire, Bookham Blue, Yellow Sunflower and White Star.

The members of the alpine section were even more worthy of note. Fine specimens of the old favourites, such as *Argus*, *Dazzle*, *Gala*, *Vanity*, *Majestic*, J. T. Bennett Poë, still hold their own with up-to-date varieties, such as *Bookham Pride*, *Queen Mary* and *June Douglas*, which were also finely in flower. Large batches of seedlings were also in bloom.

Mr. Cookson and his able gardener, Mr. W. J. Stables, are very enthusiastic hybridists with other plants, and they are now raising some of these beautiful florists' flowers. They have obtained some remarkable seedlings, not yet named. When their enthusiastic owner feels disposed to exhibit them they will, I feel sure, meet with widespread appreciation. *H. J. C.*

# FEED YOUR FLOWERS with FISON'S FERTILIZERS

SOLD DIRECT TO THE PUBLIC—CARRIAGE PAID

Herbaceous borders, in common with Roses, Chrysanthemums, Delphiniums and Asters, etc., respond very readily to Fisons.

## CANARY GUANO

a scientifically compounded and perfectly blended General Garden Fertilizer. 7lbs. 3/6; 28 lbs. 10/-; 1 cwt. 32/- Carr. paid.

To maintain turf in the best condition throughout the summer, Lawns should be fed with Fisons'

## LAWN GUANO

as used by many of the leading Tennis Clubs. 7 lbs. 4/-; 28 lbs. 11/-; 1 cwt. 33/- Carriage paid.

The most nourishing and economical food for use in the Vegetable Garden is Fisons'

## CHAMPION FERTILIZER

7 lbs. 3/-; 28 lbs. 8/6; 1 cwt. 26/- Carriage paid.

## DWARF BEDDING DAHLIAS

We have a very large stock of plants in fine condition.

**COLTNESS GEM** The most popular bedding Dahlia. Its brilliant scarlet flowers are produced in the greatest profusion during summer and autumn till frost comes. Habit dwarf and compact, height 18 inches. Plants from pots 12 for 7/-, 25 for 13/-, 50 for 25/-, 100 for 47/6. Carriage paid for cash with order.

**PAISLEY GEM** A new variety of the greatest merit. Flowers brilliant orange-scarlet with a double row of ray florets. It is quite as dwarf and compact in habit, and is even more floriferous than Colt-ness Gem. A decided acquisition which should be in every garden. Plants from pots, 12 for 13/-, 25 for 25/-. Carr. paid for cash with order.

*Catalogue of Hardy Scotch Green Bedding plants may be had post free on application.*

**AUSTIN & McASLAN**  
91-95, Mitchell Street, GLASGOW.

## WILL YOU EXCHANGE

your surplus Alpine or Herbaceous Flowers for BULBS?

Herbert G. Longford, Abingdon, Berks.

If so, please let me know what you have to offer, and I will send you my Bulb List to choose from.

## Have a good one!

For a good garden have a good tap that never leaks, is frost proof, gives the same flow of water as from an open pipe, and saves the gardener time and labour in watering.

### THE INDESTRUCTIBLE FULLWAY NORWICH VALVE

has a straight or bent Nose for push-on, screwed or half-a-turn instant hose coupler similar to a fire cock.

Solidly made in brass, with metal hand wheel. This pattern for instant hose coupler 3/7/- post paid. Coupler 1/9 From Stock.

List C 19 post free.

## SOME INTERESTING SHRUBS AT CANNIZARO.

A FINE collection of shrubs is well-grown and cared for in the gardens of Cannizaro, Wimbledon, the residence of E. H. Wilson, Esq. The spacious gardens cover many acres, and their most attractive features are the wild garden and the shrub border.

The extensive kitchen garden and the glass-houses are divided from the pleasure grounds by a large wall, against which are growing several species of *Ceanothus*, which seem to have found ideal conditions, for some are ten feet or more tall, and are all flowering freely. Three species are outstanding—*Ceanothus papillosus*, *C. thyrsiflorus* and *C. dentatus*. Of these, *C. papillosus*, the most vigorous, is a species with small, rough, shining-green leaves which are somewhat viscid in the spring. It is of very rapid growth and well worth planting against a south wall.

One of the houses is set aside for the cultivation of difficult or half-hardy shrubs in pots, and here a strong, sweet scent, as of Lilies filled the air, but as no Lilies were apparent, it did not take long to trace the source of this perfume to *Rhododendron fragrantissima*, some three or four feet high, bearing loose heads of large, white flowers. The incident reminded me of entering an alpine house some years ago and smelling a perfume like that of Sweet Peas, which I traced to *Primula Wardii*. The house contains many new and rare *Rhododendrons*, some of them raised from seeds. In one corner stood splendid specimens of *Magnolia Fraseri* and *M. macrophylla*, both of which have very large and handsome leaves, and are well worth growing for their foliage only. A good plant of *M. Wilsonii* was also noticed. *Nandina domestica*, although not in flower, was beautiful with its red-tinted leaves, while *Veronica Hulseana* decorated another corner of the house with its long spikes of lilac-coloured flowers.

The wild garden provides a feast of good things. Here is a large and varied collection of *Camellias*, *Magnolias* and *Rhododendrons*. By far the most conspicuous among the *Camellias* was the semi-double, pink variety, *Lady Clare*, which received an Award of Merit from the Royal Horticultural Society so recently as April 5 last, when it was exhibited by Lionel de Rothschild, Esq. The specimen at Cannizaro was full of flowers at the time of my visit with many buds to open. The rose-coloured *Camellia Nagasaki*, with double flowers; the deep rose *C. Donckelaari*, and the white *C. japonica*, were other noticeable *Camellias* in flower.

A recent introduction among the dwarf *Rhododendrons* was in full flower; this is unnamed and carried the number 15,356, Forrest. It is of the *R. hippophaeoides* type, and very much resembles that charming species with its small leaves and tiny heads of lilac-coloured flowers. Another dwarf species which was making a grand display was the delicate pink and white *R. racemosum*. The white-flowered *R. Dr. Stocker* showed up well against a background of darker foliage while the dwarf *R. ciliatum* was equally attractive, and seems to have found a congenial home in the wild garden at Cannizaro.

*Rhododendron Gauntlettii* × *R. Thomsonii* is a large, early-flowering variety, very like *R. Cornish Cross*; *R. Fortunei* × *R. Thomsonii*, with large, rose-pink flowers, is another early-flowering hybrid making a good display.

These gardens contain a very representative collection of *Ericas*. Tall bushes of the white-flowered *Erica Veitchii* were very fragrant in the afternoon sun, while the coloured flowers of *E. australis*, close at hand, were evidently favourites with the bees. The dwarf *E. carnea* and its white variety were almost over, having flowered nearly all the winter.

Among other dwarf shrubs I was glad to see *Viburnum Carlesii* and *Osmanthus Delavayi* growing finely in close proximity. The sweet scent of *Viburnum Carlesii* filled the air for some distance. Many flowering Plums, Cherries and Peaches are included in the Cannizaro collection, and one of the most beautiful I saw was *Prunus serrulata Hizakawobeni*, a double,

rose-coloured Plum. During the latter part of May and the early part of June, flowering shrubs provide a wealth of colour at Cannizaro. A. Donald Blaxill.

## THE WORTH OF HYBRID RHODODENDRONS.

WHATEVER arguments the purist may advance against hybrid *Rhododendrons*, as contrasted with species, he cannot object to them on the ground of garden value. That they have in abundance; and it is in years like 1926 and 1927 that this fact is brought home to one. In normal years the Himalayan and Chinese species give good value, and few will be found to deny that, plant for plant, they beat the hybrids in colour, vigour and grace. Then comes a May frost, following a heavy flower crop, as

by despised hybrids. Meanwhile, those who enjoy colour should look at the beds of *Rhododendron*, such as *Cynthia*, planted in the parks, or take a walk through the *Rhododendron Dell* at Kew.

Amongst notable hybrids in the latter place are the following:—*Alice*, flowers pure pink; *Michael Waterer*, flowers crimson, with black spots; *Mrs. Anthony Waterer*, pink in bud, opening white, with a large brownish yellow mottled patch; *Purity*, white, with a small yellow patch, very fragrant; *Edith A. Boulton*, pink; *The Queen*, pale purplish pink with a yellow blotch; *Victoria*, magenta with darker spots; a very showy variety; *Sigismund Rucker*, deep crimson with large black splash; *Charles Dickens*, cherry-red; *Nevatium*, pink, with a few well defined darker spots; *Lord Palmerston*, like the last, but bigger flowers in finer trusses; *King of the Purples*, a deep rich colour recalling that of *R. niveum*, with dusky spots; *Catawbiense fastuosum flore pleno*, which looks surprisingly blue against

FIG. 198.—RHODODENDRON LODERI VAR. KING GEORGE.

happened last year. The young growths are killed, and in the following year there is hardly a bloom to be seen; such flowers as there are receive their final quietus in an April frost!

But the best hybrids are supremely indifferent to all these alarms and excursions. They were in full bloom late in May and had been beautiful for three weeks. When the recent April frost was cutting the species down right and left, the hybrids were untouched, for the buds were still tightly closed; when the May frost of last year was spoiling all prospect of flowers this year by ruining the young growths, the hybrids lay low and said nothing, and this year responded with a heavier flower crop than ever! And the secret of that is, that their new growths develop late in the spring.

And so, as far as *Rhododendrons* are concerned, it has been left to the hybrids to cover the nakedness of the land this year, and right well have they done it; one trembles to think what the *Rhododendron Society's* second show would have been like but for the material supplied

the reds and purples; *Doncaster*, scarlet; *Mrs. F. Hankey*, cherry-crimson; and *Gauntlettii*, white suffused pink; magnificent flowers in large, loose trusses.

The majority of those mentioned are large bushes, and most of them make a wonderful display; by the time these are over others will be flowering. It may fairly be objected that many of these hybrids are in bad taste as regards colour; the rawest magentas, purples and crimsons flaunt their colours side by side, and no attempt whatever has been made to keep them apart and restore harmony. But of their powerful effect there can be no two opinions, and it is clear they will carry us on far into June.

*Rhododendron Loderi* var. *King George* (Fig. 198) is a magnificent garden plant.

It may well be that China, for all the hundreds of *Rhododendrons* she has sent us, will, in the long run, when the time comes to assess her gifts fairly, to weigh the pros. and cons., and pronounce final judgment, be chiefly remembered for her contribution of dwarf species. F. K. W.

**EDITORIAL NOTICES.**

**ADVERTISEMENTS** should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden W.C. 2**

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the **EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Editors and Publisher.**—Our correspondents would oblige by delaying in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the **PUBLISHER**, and that all communications intended for publication or referring to the literary department, and all plants to be named, should be directed to the **EDITORS**. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron., Rand." or by telephone, to Gerrard, 1543.

## A DAY ON A SUGAR ESTATE.

THE sugar estates of British Guiana are situated on the flat plain of marine alluvium that occurs along the coast and for a short distance up the larger rivers. The largest estate is the Diamond plantation, on the Demerara river; this is some seven thousand acres in extent, and produces about 15,000 tons of sugar annually. It was my good fortune to be able to spend a day on this estate during a recent visit.

Owing to their low levels, a large proportion of the Sugar cane lands are below high-tide mark, hence, in places, extensive sea-dams have to be maintained. The estate is laid out in more or less regular rectangles, intersected by numerous canals which serve alike for transport, drainage and irrigation. The land generally is of a very heavy, clayey nature, and necessitates the opening of narrow cross drains at frequent intervals on an elaborate system. In the rainy season drainage has to be maintained by pumping the water from these drains into the larger canals, which discharge into the sea or river at low-tide.

As may be readily understood, the tillage of these lands under such conditions is a big problem, and although on the Diamond plantation both manual and mechanical tillage are practised with success, power tillage is fast gaining ground. Several types of tractor ploughs are in use (Fig 199), but tremendous strength is necessary to withstand the conditions, and the Fowler steam-cable plough appears at present to be the most efficacious. In this direction, it may be noted that the introduction and increase of mechanical tillage is seriously affecting the supply of suitable manure, which has never been over abundant. The constant use of sulphate of ammonia has also so altered both the mechanical and chemical condition of the soil that planters are being forced to reconsider their methods of manuring, and empty Adco drums are now familiar objects on many of the sugar estates.

The growth of Sugar-cane is more or less continuous throughout the year, but cutting and grinding must necessarily take place during the dry seasons, namely, early spring and late summer, consequently tillage for new plantations takes place so soon as the final crop of an established quarter is harvested, and replanting is carried out so soon as prac-

ticable. The first crop after planting is generally the heaviest, but an estate is usually divided so that at least three and sometimes four crops are reaped from one planting, thus dividing the tillage work into three-year or four-year periods. The greater part of the field work, generally, is done by hand, the canes being

fixed triangularly, going in between the feed roller and the top roller and then out between the top roller and the delivery roller; when leaving these, water is sprayed on the crushed cane, and again, as it passes the last set of three rollers. A conveyor then takes the finally crushed sugarless cane, now called "megass,"

FIG. 199.—MECHANICAL TILLAGE ON A SUGAR ESTATE IN BRITISH GUIANA.

weeded, thrashed, cut and carried from the fields to the punts for transport to the factory by hand, hence the success of the industry is dependent on a plentiful supply of labour. All the transport is by water, the canes being carried in large, metal-lined punts from the various parts of the estate, along the canal to the factory (Fig. 201).

On arrival at the factory the punts are unloaded on to a conveyor which takes the canes to the first rollers of the train of mills. On the way they pass under revolving knives which level them up, and the rate of feed to the first rollers is regulated by a clutch which can stop the

to the boiler where so much as is required for feeding the furnace is conducted down a chute into the fire-box. The remainder is dumped on the ground and is used for littering cattle pens, and through this means helps to supply the manure applied to land in the preparation of new plantations.

The cane juice from the mills is pumped through heaters and passes to tanks or clarifiers. At the time of my visit, syrup was being manufactured from the juice; therefore the juice was only heated to boiling point to cause the impurities to settle or rise to the surface. After this is done the clear juice is drawn away and passes

FIG. 200.—MOVING A TRACTOR OVER A CANAL.

conveyor. The first pair of rollers is deeply grooved and crushes the canes so as to give a regular feed to the next rollers, the rest of which are in sets of three, so arranged that each succeeding set gives increased pressure to the cane.

From the first pair of "chewing" rollers the cane is passed on to the next set of three

through very fine gauze to what is called the "triple effect," in which it is concentrated to a certain extent in vacuum. From here it is pumped to the eliminators, where it is boiled and any impurities that rise to the surface are skimmed off, and thence to the vacuum pans, where it is further concentrated. From the vacuum pans it is conveyed to open pans heated

by steam, where the final concentration takes place to the desired density. Some syrup is boiled to a density of 41 Baume; the one I saw being manufactured was a special kind, boiled to a density of 43 Baume. From the open

Previous to and during the great war the industry was considerably helped by the value of rum, which is produced from the molasses after its separation from the sugar, but during the last few years the decrease in the demand

## ECONOMIC PLANTS OF THE BAY ISLANDS (HONDURAS).

(Concluded from p. 305.)

**THE** Vanilla (*Vanilla planifolia*) is a climbing Orchid found in the shady forest, but it is never cultivated in the Bay Islands. The pods, or beans, are collected a little before maturity and dried, when they become brownish in colour. They are used to flavour candies, guaro (rum) and Tobacco.

The Lemon Grass, Fever Grass or Zacate de Limón (*Andropogon Nardus*, L.) is a small, cultivated grass, generally called "tea," as in the Bay Islands it is exclusively used to make tea; it has a pleasant, Lemon-like scent. Its home is East India, where oil is extracted from the leaves and stem.

The Madre Cacao or Madera negra (*Erythrina* sp. or *Gliricidia maculata*, H. B. K.) is a small, Leguminous tree, with very pretty pink flowers. It is easily propagated from cuttings, and therefore is often used to make living fences. It furnishes a good quality of cabinet wood; the bark ground and mixed with Maize, is used by the Ladinos as rat poison. On the mainland this tree is planted in Cacao plantations as a shade tree, hence the name Madre de Cacao (Mother of the Cacao).

The Red Mangrove or Mangle Colorado (*Rhizophora Mangle*) abounds around the tidal swamps, and at the borders of the lagoons. This tree does not reach such a great size as the white or the black Mangrove. The stem begins at a distance of five feet to six feet from the ground, being supported by numerous air roots which form an impenetrable jungle. The red dye contained in the bark turns the water in the "Manglares" a dirty, red colour. Locally, the wood is used in boat-building and in making hogsheads, and occasionally in making violin bows and walking sticks. The bark is used for tanning and dyeing.

The Black Mangrove or Mangle Negro (*Avicennia nitida*) is a fairly tall tree with black bark, found in the lowlands close to the sea-

FIG. 201.—BARGE LOADED WITH SUGAR CANE FOR TRANSPORT TO THE FACTORY.

pens the syrup is pumped through an apparatus cooled by water, in which it is cooled rapidly, and then it passes to the storage tanks to be filled into puncheons, made of Oak or hardwood, of a capacity of 110 wine gallons, in which it is shipped to Canada and Newfoundland. About 8,000,000 wine gallons of syrup are shipped every year to the above countries where it is used in various ways. It is used as food chiefly by the fishermen, farmers and lumbermen, and is very nutritious and beneficial, practically eliminating the necessity of aperients. It is the pure product of cane juice, not sulphured to produce colour, and has no chemical added to it. Its colour is darker than that of golden syrup, but the flavour is better, and it is a pity it is not known in England. The syrup I saw being made was sold at 1s. 3d. per wine gallon to the shipper, plus the cost of the puncheon, which was 26s.

When making sugar, the juice is heated in the clarifiers and lime is added. The clear liquor then goes through the same process as for syrup until it reaches the vacuum pans, where it is boiled into sugar grain under pressure. The semi-solid mass then goes to centrifugal machines in which the molasses is separated from the sugar. All the settling from the juice in the clarifiers is again heated and goes to the filter presses; the clear juice from this being mixed with that of the first extraction and the "mud" is thrown in on the pens, where animals eat it. The sugar manufactured is of three classes, the greater bulk being the ordinary vacuum-pan crystals for the Canadian and American markets, but some estates make the well-known Demerara crystals for the English market, and a comparatively small quantity of white sugar is also made.

It will be noted that nothing is lost in the manufacture of sugar from cane, and the only part of the refuse fibre which is lost to the soil is that which is burned for raising steam. Most of the concentration of the juice is done in vacuo, only the exhaust steam from the engines, etc., is used; otherwise it would be impossible to raise enough steam from the "megass," and some other kind of fuel would have to be imported. I understand that it is the ambition of all factory engineers to fix the furnaces to the boilers so as to economise in the use of "megass" so much as possible and thus retain it for conversion into manure for the benefit of future crops.

for rum has considerably affected the financial position of the growers. A certain amount of rum is still made, however, and as I was able to see the process, a few notes on it may be of interest. For this purpose molasses and water are mixed by conducting the two into large vessels, where it is thoroughly mixed by agitation as it passes in. This liquor is then conducted to large, open vats, where it is allowed to ferment for a period of thirty-six hours. It is then con-

FIG. 202.—HEAPS OF SURPLUS "MEGASS" OUTSIDE A SUGAR FACTORY.

ducted to the stills, the final liquor being a colourless liquid containing about forty per cent. of alcohol. The colouring is done by adding burnt sugar caramel, the depth of colour attained being governed by the demands of the various markets. Molasses and Molascuit, a cattle food, two other by products, are also exported to a large extent, and a considerable quantity of industrial alcohol is produced which is used to drive machinery on the estates. W. Auton.

shore. It is often used for house-posts, which last a long time in the damp soil.

The White Mangrove, or Mangle Blanco (*Avicennia officinalis*, syn. *A. tomentosa*) is a fairly straight, tall tree, with grey bark and tomentose leaves. The wood is not so durable as that of the red and the black Mangrove; it is, however, esteemed as firewood.

Mahoe, Majao and Majagua are names applied in Central America and the West Indies to several species of *Thespesia*, *Paritium* and *Hibiscus*.

The Mahoe of the Bay Islands (*Thespesia* sp.) is a small tree found only around brackish water. It has heart-shaped leaves, and pointed, large, pretty yellow flowers, which turn purple in colour when about to fall off. The strong bast fibre of this plant is not extracted.

Contrayerva (from Spanish *contrayerba*) and Guaco are the names applied to several twining vines of *Dorstenia*, *Aristolochia* and *Willughbaeya* (*Mikania*), the aromatic, bitter roots and leaves of which are used locally as a remedy for intermittent fever, rheumatism, dyspepsia, asthma, cancer, syphilis, cholera, etc. They are also reputed to be an efficient blood tonic and an active diaphoretic, stomachic, diuretic and vermifuge. The remedy is administered in the shape of infusions of the mashed leaves or decoctions of the boiled roots. Cases of fish poisoning, which occur rather frequently at certain times of the year, are efficiently cured by this remedy.

On the neighbouring mainland of Central America, Guaco and Contrayerva are the most common remedies used in the case of snake bites. A very strong infusion is given to the sick person every hour, gradually decreasing the dose. In order to increase the effect, the infusion is heated before administering, but care must be taken not to overheat it, otherwise all its volatile principle will evaporate. Hot poultices of the heated stem and leaves are also laid upon the wound.

Some of the bushmen preserve the mashed plant in rum and carry a small bottle of this tincture with them when travelling in the bush; others claim to make themselves immune from snake bite by chewing from time to time a little of the leaves. The "snake charmers" render themselves immune by making a small incision in their flesh, in which they pour a few drops of the juice of the Guaco. *Edouard Conzelmus, 33, Boulevard des Batignolles, Paris.*

## ORCHID NOTES AND GLEANINGS.

### CYPRIPEDIUM ACOMB.

THIS most desirable hybrid, which is the result of intercrossing *C. Carola* and *C. Memoria F. M. Ogilvie*, is one of the many fine seedlings recently flowered in the collection of Clive Cookson, Esq., Nether Warden, Hexham. The dorsal sepal is three-and-a-quarter inches broad and holds itself in perfect form; the upper two-thirds is heavily line-spotted with rich purple, and there is a broad band of purple from the base to the apex; the basal third is greenish-yellow blotched with brown-purple. The petals are five-and-a-half inches across the flower; they are two-and-a-quarter inches broad; the upper halves of the petals are rich brown-purple, mottled and margined with yellow, the basal halves yellow with suffused brown markings. The lip is greenish-yellow, suffused in front with brown-purple. This hybrid is a fitting companion to the many fine *Cypripediums* in the Nether Warden collection.

### ORCHIS FOLIOSA.

THE Maderian Orchis is one of the finest of hardy Orchids and rarely fails to provide a handsome display of bloom at this season. The inflorescences attain a height of from one foot to two feet or even more. The plant is well furnished with foliage leaves from one inch to two inches long, surmounted by fine spikes of rosy-purple flowers.

The plant is suitable for growing in a bog or a shady nook; it needs abundant moisture at the roots and a good depth of rich soil. It should, however, be remembered that, like all other members of the Orchideae, the plant is impatient of root disturbance or removal of any description.

An excellent plan is to allow the ripe seed-capsules to disperse their seeds over the whole area naturally, resulting in a goodly crop of plants in the near future. *T. D. Boyd, 6, Clarence Road, Kew Gardens.*

## A REVISION OF VIOLAS.

(Continued from p. 357.)

*V. CHELMEA*, Boissier and Heldreich, is a woody-rooted species, thereby differing from the palustris *Violas*. It is extremely rare, having been found only on the higher rocks of Mount Chelmos in Greece, and on Mount Velez, in Montenegro. The flowers are lilac, with whitish centres; and, unlike *V. palustris*, the plant throws no stolons.

*V. Clementiana*, Boissier, is identified by Farrer with *V. grandiflora*, Grisebach, but the latter is in reality synonymous with *V. Zoysii*. In some respects *V. Clementiana* approaches *V. altaica*, and in others *V. Zoysii*, and thus may be regarded as intermediate between the *calcarata* and *altaica* groups. It is an exceedingly dwarf plant, not exceeding three inches high; is densely leafy and bears one conspicuous yellow flower on each stem. Boissier gave its home as Macedonia (whence, apparently, the reference to Scardus in Farrer), but it is known authentically only from Mt. Olympus, near Brussa in Asia Minor (the classical locality of the true *V. gracilis*), where it grows on rocks near the summit, at about 8,100 feet, among the snow.

*V. Comollia*, Messara, requires to be re-discovered. It is very close to the typical *V. cenisia*. As to its cultivation, little or nothing is known. M. Correvon, I understand, once had it, but has lost it. M. Correvon declared it to be the most wonderful of the *Violas*; and it is reputed to be the most fragrant. This gentleman told me, a year ago, that he intended to collect *V. Comollia* yet again; but even a much younger man might have qualms about the long expedition involved. *V. Comollia* grows only in a comparatively restricted area in the Bergamask (or Orobian) Alps, which run eastwards of the Lake of Como; its centre is the mountain called La Redorta, and it inhabits rocks at about 8,000 feet. It may be of interest to possible collectors to quote here a summary of the route given by Mr. Douglas Freshfield, quondam President of the Alpine Club, written so far as I remember, in the 'eighties—going up from the Valtellina side, near Sondrio: "Another steep ascent . . . leads to the last Alp. Above this the glen is mostly stones and the scenery is extremely savage. . . . Our local guide led us to a broken-down path which climbed very steeply among avalanche debris. . . . The crest can be gained by climbing a long, dull, snowy trough. On the broken crags near its head, *V. Comollia* was growing profusely." The varying descriptions of the colour of the flowers throw doubt on them all. Becker describes it as pale purple or yellow, with an orange or yellow centre; Correvon describes it as bright rose with a yellowish green reverse to the petals; Farrer has it as "flaming vinous rose, more rich than even in *V. bosniaca*, with the same opaque reverse of nankeen yellow to the petals"; Mr. Freshfield describes it as just "bright mauve." The only point on which everybody seems to be agreed is that *V. Comollia* is *par excellence* worthy of re-discovery.

*V. conspersa*, Reichenbach, and *V. labradorica*, Schrank, are both Wood *Violas*, akin to *V. sylvestris*, and often confused one with another. The *Kew Hand List* gives *V. labradorica* as synonymous with *V. canina* var. *Muehlenbergii*, whereas the latter is in reality *V. conspersa*. *V. labradorica* is alpine, coming from Greenland and Labrador and so far south as the mountains of New York State. *V. conspersa* is lowland and southern, extending from Quebec to the mountains of Georgia. The former is dwarfer, has the leaves slightly hairy on the upper surface, a less branching root, quite obtuse leaves, stipules entire, deep violet flowers, and blooms in July and August. *V. conspersa* on the other hand is rather taller, is quite glabrous, has a much-branched root, the upper leaves almost acuminate, the stipules longly fringed, pale violet flowers, and blooms from April into May. Farrer calls it a "long-armed" plant, by which phrase I imagine he refers to the long fimbriations of the stipules, giving them a bristly appearance.

*V. corsica*, Rouy and Foucauld, is synonymous with *V. Bertolonii*; it is very distinct from *V. calcarata*.

*V. cretica*, Boissier and Heldreich, is a Cretan form of *V. Dehnhardtii*, Tenore, which is itself a variety of *V. alba*, Besser, this last, in turn, being a near relative of *V. odorata*, the Sweet Violet. It is not, therefore, a bog Violet like *palustris*.

*V. cucullata*, Aiton, common in cultivation, is not confined to the New England States, but is one of the most widespread of American *Violas*, from north to south throughout the eastern U.S.A. This, the Hooded Violet, takes its name from the inverted, cowl-shaped form of the young leaves. In summer, after flowering, the leaves become very broad, and the whole plant becomes a very leafy clump which (as in the case of many *Violas*) might give a wrong impression of the character of the plant, were not such an impression corrected by knowledge of the early spring state at flowering time.

*V. Curtisii*, Forster and *V. sabulosa*, Bor., are both seashore forms of *V. tricolor* (*V. tricolor*, s.b.-sp. *genuina* var. *maritima*, Schweigg.).

*V. declinata*, W. and K., is by Farrer made synonymous with *V. Dubyana*. This is an error originating with Gaudin in the *Flora helvetica*, repeated by Reichenbach and Caruel. *V. declinata* is a *Viola* belonging, like *V. Dubyana*, to the lutea group, but very different in appearance from *V. Dubyana*. It used to be associated with *V. elegantula* (*V. bosniaca*), but the latter is now classed with the *gracilis* *Violas*. It is a tall plant, from six to sixteen inches, with rather large, blue flowers, long in shape rather than round, the two upper petals overlapping and much larger than the lateral, and held well away from and above the lateral, while the lateral and lowermost are huddled together, thus giving the bloom its elongated, startled look, not unlike the bloom of *V. Dubyana*. It hails from Transylvania, Hungary and Galicia, whereas *V. elegantula* comes from the mountains of the eastern Adriatic, and *V. Dubyana* comes from the Bergamask and the Garda Hills. *V. declinata* may be obtained true from several English nurseries.

*V. delphinifolia* is simply Nuttall's name for *V. pedatifida*, Don. Farrer treated them as two distinct species.

*V. dichroa*, Boissier and Huet, belongs to the *altaica* group; it is very dwarf, however, from near the snows at about 10,000 feet, with comparatively large flowers of violet or reddish-violet, and longish spur.

*V. dissecta* was Ledebour's name for what is now placed as the variety *multifida* of *V. pinnata*. It is, in short, the Siberian form of the European *V. pinnata*. Whether it is easier to grow than its European cousin, which appears and disappears from catalogues, remains to be seen. It is only the divided-leaf form which relates it to *V. pedata*, with which it has no other botanical affinity.

*V. Dubyana*, Burnat, is, to my mind, one of the most beautiful of all *Violas*. Plate 47 in *The English Rock Garden* is an excellent portrait, showing the lowermost petal drawn away from the others, which are staringly erect. I imagine that Farrer did not see this *Viola* in bloom on the Tombea; his expedition to the Tombea was at a time when *Primula spectabilis* was at the acme of its blossom, which would be in early June, whereas *V. Dubyana* does not flower till the end of June. Otherwise he would not have associated it with *V. valderia* or *V. cenisia*, from which it is very distinct in habit. It is now classed among the lutea *Violas*, a fact which, I imagine, accounts for its easier cultivation, despite the fact that it is extremely hard to come by. I do not know of any English grower. On the Tombea there are two distinct colour forms—one violet, the other claret-purple. It flowers on the sunny side of the mountain, in company with *Linum austriacum*, and, like it, may not be altogether resistant to our raw winters. It is not confined to the out-of-the-way Tombea, but is widespread over the Garda Alps and the Bergamask, being, perhaps, more accessible on either the Alp Gaverdina near Tione in the Val Judicaria, or on the Grigna above the lake of Como, near the Rifugio Escursionisti Milanese. As there is abundance of it in its native homes, I hope it may be collected and permanently introduced into English gardens. *E. Enever Todd, Lt.-Col.*

## THE LEADING GLASSHOUSE FUMIGANT

THOUSANDS OF TOMATO PLANTS ENTIRELY SAVED

Be satisfied with the best—the cheapest in the end.  
Commended by the Royal Horticultural Society.

Cubic ft.	1,000	2,000	4,000	8,000	16,000	32,000	64,000

## THE 'PATTISSON' HORSE (LAWN) BOOTS

## Pattissons' New Graduator Distributor

Improved 1924 Pattern. Patent applied for.  
to cover 4 ft. — capacity 1½ bushels  
Made in 3 sizes  
" 3 ft. " " "  
" 2 ft. " " "

The Simplest, Quickest, and most Effective Top Dresser. Adjustable to any powder material. No waste. Great time and labour saver. Illustrated Price List with Testimonials from the makers:—

"The ONLY Economical Ones."  
USED in the Royal and thousands of the Principal Gardens, GOLF and CRICKET GROUNDS, and exclusively at the Oval S.C.C.C. for past 20 years.  
OVER 10,000 SETS USED IN THE U.K.

Fig. 1, for Shod Horses. Fig. 2, Welked Boot.  
HUNDREDS OF TESTIMONIALS.

The Field says: "As good as anything that could be devised."

Mr. Wm. Hardy (Gardener to Lt.-Col. Hon. W. Guinness): "The boots supplied 17 years ago are still in use and have always been satisfactory."

## SAREL'S PATENT SPIKED ROLLER

COMM. HILLIARD, R.N., The All England Lawn Tennis Club, Wimbledon, writes: "The 'Sarel' Roller is invaluable for aerating the ground. It saves an enormous amount of labour and is most beneficial to the turf. I should be very sorry to be without such a valuable implement."

H. PATTISSON &amp; CO., STANMORE, MIDDLESEX.

## CLAY'S FERTILIZER

The Gardener's best friend

CLAY &amp; SON, STRATFORD, LONDON, E. 15

Manure Manufacturers and Bone Crushers.

## MAKES THE GARDEN GAY ALL THE YEAR ROUND

Sold everywhere in TINS at 10d. and 1/6; and in BRANDED and SEALED BAGS—7 lbs. 3/6; 14 lbs. 6/-; 28 lbs. 10/-; 56 lbs. 18/-; 112 lbs. 32/-. Or direct from the Works, Carriage Paid in the United Kingdom for Cash with Order (except TINS).

Every Genuine Tin, Bag and Seal bears the Trade Mark.

## WILLIS BROS.' Garden Fertiliser

**THE BEST ON THE MARKET.  
NO STABLE MANURE REQUIRED.**  
For digging in or as a top-dressing. For kitchen  
Gardens or Herbaceous Borders.  
1 cwt., 15/-; ½-cwt., 8/-; 28lb., 5/-; £14 10/- per  
ton. All Carriage Paid.

### UNIVERSAL SOLUBLE MANURE.

**FOR FRUIT AND PLANTS.**  
Used in the Public Parks and Gardens for flower beds,  
etc. A scientific combination of all the valuable  
manurial agents best suited to plant life. The best  
Concentrated, All-round Manure in use.  
1 cwt., 25/-; ½-cwt., 13/-; Carriage Paid.

### QUASSIA COMPOUND.

Liquid Quassia Extract, etc., the cheapest reliable  
Insecticide known. Mixes instantly with water, and  
leaves no deposit. May be used with perfect safety.  
1 gal., 7/6; 5 gals., 35/-; 10 gals., 65/-; carriage paid.  
1 gallon makes 40 gallons with water.

### NICOTINE INSECTICIDE.

"Highly Concentrated." Full directions sent with  
each package. A good spring dressing for fruit trees,  
and for general use under glass. Soluble in water.  
1 gal., 15/-; ½-gal., 8/-; 5 gals., 70/-; carriage paid.

### NETS! NETS!! NETS!!!

Best Heavy Tanned Garden Nets, 1" mesh. For Straw-  
berry Beds, etc. 8 x 25 yds., 27/6; 50 x 4 yds., 27/6.  
Carriage Paid.

New Netting, 1", 2" or 3" square mesh. Carriage Paid  
Samples and Prices on application.  
Tanned Tunnis Stop Netting, prices on application.  
Melon Nets, 12 x 12, 3/6 per dozen.

### GREENHOUSE BLINDS.

Made up to any size from special quality white shading  
material. Bound all round and down centre for strength  
with stout webbing, ready to fix; or complete with  
Rollers and Fittings at small extra cost.  
Estimates and samples on application.

## EELWORM DISEASE OF CHRYSANTHEMUMS.

DURING the past few years there has appeared amongst Chrysanthemums a peculiar disease. The leaves, at first sight, appear to be suffering from an attack of rust, but examination showed that the brownish tinge, which was yellowish at first, was not regular, but in patches which increased in size, causing the leaves to shrivel up as if from extreme drought. This was particularly the case with some of the early-flowering varieties, such as Mrs. Marshall Field, Roi de Blanc and Sanctity. The plants lost vigour and gradually deteriorated as time went on. It was assumed that these varieties, like many other garden plants, had become soil-sick, or that the local climatic conditions were unsuitable and a change of stock was recommended. The trouble became more serious, however, when the same symptoms showed on the later-flowering varieties, particularly Percy A. Dove, Advance, Romance and H. W. Thorpe. Various spray fluids were used with but little effect. Cuttings for propagation were selected with the greatest care, but in time the young plants became affected. The growth was spindly, and the flowers, if any, were usually deformed, or of mediocre value. It was quite evident, therefore, that if this pest were not thoroughly investigated, and preventive and remedial measures found, the future of this very valuable winter flower would be in dire jeopardy.

### SYMPTOMS OF THE DISEASE.

In affected stock the leaves of the basal shoots are distorted and narrow, and in many the lobes are absent. In severe cases the points of the shoots become blind, ending with only a pointed petiole, as is characteristic in eelworm-infested Strawberry plants. Normal cuttings, when rooted, may become affected at the growing point, and the young plants in their struggle to make growth, produce lateral shoots as illustrated (Fig. 203). Others tend to throw up basal shoots, while Source d'Or and Tom Page make quite a distinct proliferation of basal buds, not unlike Cauliflower-disease in Strawberry plants. The leaves assume a blotched, yellowish-brown appearance, and this colour eventually spreads over the whole surface, presenting a scorched appearance. Throughout the whole season affected plants make but spindly growth, and many of the growing points become blind.

### INVESTIGATION AND REMEDIAL MEASURES.

Plants and soil were in the first instance submitted to Dr. Eales, of the Zoology Department, University of Reading, who reported that eelworms (probably *Aphelenchus Ritzema-Bosi*) were found in the leaves, roots and soil. Later on, affected young plants were sent to Dr. Percival, M.A., who reported that he found eelworms in numbers in practically every leaf, and advised the sterilisation of all soil used as a potting compost. In our case this was practically impossible as the young plants were then in four-inch pots.

It was then found—thanks to Mr. F. H. Stewart\*—that this particular eelworm, unlike practically all others of its kind, moved upwards from the soil, on the outside of the stem, on a thin film of moisture, and found entrance to the leaf through the stoma openings. That being so, it was essential that all unnecessary spraying should be avoided. The only practical method of dealing with large batches of young plants is to soak them thoroughly periodically through a rosed watering-pot. To prevent this pest from ascending, it was quite evident each soaking must be followed by spraying with a fluid that would effectually destroy the pest without killing the plants.

Batches of affected plants of the variety Tom Page were set aside and the following sprays were used, the first three being in powder form: (a) Newly-slaked lime; (b) flowers of sulphur; (c) lime and sulphur; (d) lime sulphur, one in twelve; (e) a soft soap solution and half-ounce of nicotine to five gallons of water;

and finally, to kill or cure (f) half-an-ounce of nicotine to one gallon of water. It is astonishing that the plants survived that strength of nicotine (95 per cent. purity), and which apparently sterilised the soil so that the plants are now in perfect health.

It is quite unnecessary to comment on the other sprays, except to note that lime sulphur (one in twelve) scorched the young leaves but did not kill the growing point, otherwise this was quite a good spray, and the plants, after three sprayings, have grown away quite healthily. The nicotine spray was applied, twice weekly, for about three weeks, by which time the plants were making perfectly normal growth. The spraying was then discontinued. Commercially, the four-inch pot plant is transferred to pots of nine-inch or ten-inch size. Preparations are being made for that now, and when completed the plants will be sprayed a few times to make certain that the pest has not been reintroduced in the potting compost.

It would be premature, at this stage, to state that a positive cure had been found. But our Chrysanthemums have been, for some years,

FIG. 203.—EELWORM DISEASE IN CHRYSANTHEMUMS.

affected by this pest, and they are now a very healthy lot. This, I believe, is due to spraying the plants periodically with nicotine.

### PREVENTIVE MEASURES.

It is quite evident that this Nematode has a resting stage, or can exist for long periods in the soil, which it reaches during rains or in fallen leaves. Therefore, in taking cuttings from the stock plants, preference should be given to those that are six inches or more in length, propagating the top three inches only. For should there be any eelworms in the soil, they will attack the lower leaves first, provided, of course, that there is no undue moisture about. Where practicable, sterilise all soil or sand used as a rooting-medium. Use virgin soil where possible. Basal leaves of a suspicious nature should be removed and burnt, not placed on the rubbish heap. Avoid all unnecessary sprayings if the plants show any symptoms of the disease. Give the plants at all times plenty of room, thereby building up sturdy growth, with clean, healthy foliage. The same rule should apply when the plants are housed in the autumn, when as dry an atmosphere as is practicable should be maintained by the use of a little artificial heat.

### IMMUNE VARIETIES.

I do not know of one variety that is absolutely immune to eelworms, but Favourite and Baldock's Crimson are certainly resistant; the same may be stated of Edith Cavell, Rosalind and Mrs. R. Luxford. The most susceptible are Percy A. Dove, Tom Page, H. W. Thorpe, Romance, Advance, Enfield White and Dr. Euguehard. H. H. Cook, University of Reading.

## THE GLADIOLUS.

*Continued from p. 392.)*

I OFTEN wonder why James Kelway was not honoured with the V.M.H. Born in 1815, he was throughout his long life a most devoted, original, practical and successful gardener. But I am not writing his life here. In 1889 his son, William Kelway, and his grandson paid Victor Lemoine a visit at Nancy, and brought home a new shade in Gladioli. It had purpleo-

auratus blood in it, and was the colour of the burgundy which M. Lemoine produced, with several other wines, at luncheon. James Kelway objected to the Lemoine blood being introduced, as the flowers were small and hooded; but eventually the pollen of this variety was used, and gave us some fresh shades of colour. I think James Kelway was prouder of the medal won for six hundred picked spikes arranged under the great organ at the Crystal Palace at the International Exhibition of 1871 than of any other honour. The Frenchmen used to come over to London, but I do not remember that they ever beat my grandfather. Their flowers were thought by us to be smaller than ours, and they certainly did not carry well under their system of packing. The Scotch were always to be feared as competitors late in the season. Gladioli do exceptionally well in North Britain, where they have always been popular.

There have been other raisers in England in very recent years, but my notes are of comparatively olden days. Mr. W. C. Bull, of Ramsgate, wrote me in 1912 as follows in reply to my enquiry:—"I have been working on Gladioli for the last twelve years, and raise some 50,000 seedlings year by year. The best of them are being grown on and propagated, but increase

\* F. H. Stewart, "The Anatomy and Biology of the Parasitic *Aphelenchus*." *Parasitology* XIII.

is very slow in my soil and climate here. I used to send up some of my best to the R.H.S.—three of these were given Awards of Merit. But I found that the opinion of the R.H.S. Committee differed so very much from mine as to the merits of a good *Gladiolus* that I have given it up, and hope to find the trials of the National *Gladiolus* Society a much more satisfactory test. I may say that I have concerned myself with trying to improve the constitution of the plant more than the colour, etc., and I think I can say that it has been successful to a small extent, but it takes a long time and trials of culture in different soil and sites before one can be very certain. We have a large number of varieties now in the yellows and pinks; the latter capable of standing the full glare of the sun without showing any magenta tint. I grow rather over an acre of *Gladioli*."

Messrs. Burrell, of Cambridge, at the same date, wrote me as follows:—"Our late Mr. John Burrell was a successful raiser of new *Gladioli*, and for many years annually sent out a set of new varieties, all hybrids of *Gandavensis*. He very much favoured those varieties that opened a spike of flowers at once; under ordinary good cultivation many of them would open twelve, fourteen and sixteen flowers at one time. Unfortunately, many of the best are lost to cultivation."

I cannot recollect who raised *Brenchleyensis*, so called, I believe, from Brenchley, in Surrey. It was, and still is, a very distinct kind. I find it offered in Kelway's price lists in the 1860's at 6d. each.

2.—Mr. William Bull, of Chelsea, introduced *G. purpureo-auratus* from South Africa, and Victor Lemoine in the 'eighties crossed it with *Gandavensis* hybrids, and brought about the Lemoinei type, noted for the very handsome and conspicuous blood-red and golden blotches on the lower petal. The upper petals are extremely hooded in form, and the flowers are of medium size, so that they are not by any means, although attractive, so showy as the large-flowered sections. The blooms are on longer slender stems, and two to four at most are open together. It is prolific, as it produces numerous cornets, and it flowers some ten days earlier, and is looked upon as being rather more hardy than the *Gandavensis* section.

(3).—*Nanceianus* was the first hybrid of another section which we owe to Messrs. Lemoine. It originated from a cross between *G. Saundersii* and varieties of Lemoinei, and was first exhibited at the Paris Exposition Universelle of 1889. The flowers are large and broad, sometimes even six to seven inches across, and the lower portion bears the beautiful lacings, mottlings and splashes of *G. Saundersii*. The spike is comparatively short, a few flowers are open at once; it has not such a sturdy habit as *Gandavensis*, and like Lemoinei, the stems are usually slender.

(4).—The Kelwayi section is composed of crosses between Kelway's best *Gandavensis* hybrids and the finest of *Nanceianus*. This cross produced flowers of immense size with spikes of fair length, colouring of nearly every beautiful hue and some quite curious shades, also with the characteristic markings which show the *G. Saundersii* blood. They are by far the most attractive of all the really large-flowered kinds, and in time we shall probably obtain varieties with quite long spikes.

(5).—"The history of *G. Childsii* is rather confused. Many years ago Herr Max Leichtlin, of Baden, made a similar cross to that of Mr. Froebel, who raised *G. turicensis*, and sold the hybrids obtained to a French nurseryman, from whom they were purchased by an American firm, the stock of which afterwards went to Mr. Childs, of Floral Park, who gave them his name and pushed them successfully." (Philippe de Vilmorin). The cross was *G. Saundersii* × *G. Gandavensis*. Dr. Van Fleet, of Little Silver, New Jersey, U.S.A., raised princeps by crossing *G. cruentus*, a native of South Africa, with *G. Childsii*. It has a fine, open flower of splendid colour, and blooms very late, but only two or three flowers are open at a time on the short spikes. There are several well-known seedlings from this cross, and the class has been blended with *Nanceianus*, *Childsii* and *Gandavensis*, and has influenced them in the direction of blood-red colour, and openness of flower, although

these qualities were present before. *G. cruentus* was first sent to William Bull, of Chelsea, by a Swiss living at Drakensburg, Natal, and Dr. Van Fleet made his first crossings in South Africa.

(6).—Although the largest, the most majestic, brilliantly coloured and strikingly marked, *Gladioli* belong, in my opinion, to the sections 1, 2 and 4 described above, yet without doubt the varieties by far the most elegant and graceful in outline are those raised from *G. primulinus*; and as to colouring, in their present initial stage of development they are perfectly delightful in the softness of their hues, to which may be applied those rather trite terms "artistic" and "aesthetic." They are, moreover, the most prolific of all *Gladioli*. These and the ease with which new seedlings can be produced are good reasons for their taking the world by storm. They are so prolific because the bulbils are borne on long stolons away from the corm and develop independently more readily than those tucked under the corm. As there has been some controversy as to their origin, I have endeavoured to collect what is known on this point, and to straighten out the tangle as fairly as I can. Mr. C. H. Wright, in the *Botanical Magazine*, t. 8,080, states that *Gladiolus primulinus* (species) "was discovered in the Usagara Mountains in 1887 by Mr. J. T. Last, who sent corms to Kew, where the flowers were first produced in 1890." James Kelway.

(To be continued.)

## NOTICE OF BOOKS.

### \*The Field-Club Flora of the Lothians.

EDINBURGH botanists have long been interested in their local flora, which they have now extended to embrace the three Lothians. This has been the means of greatly increasing the number of plants recorded in *A Catalogue of the Indigenous Phenogamic Plants Growing in the Neighbourhood of Edinburgh* (1824). The new list is by no means confined to indigenous plants, but includes an immense number of aliens, casuals and subjects known to have been planted, even to *Ulmus glabra* var. *pendula* in St. Andrew Square, to which *U. glabra* var. *Camperdownii* might have been added. The botanists have not lacked bravery in restoring Hudson's original name of *U. glabra* for the Scotch Elm (*U. montana*), for Hudson himself corrected the name in his second edition. On the whole the nomenclature is quite up-to-date, and possibly rather in front of the times, in such cases as *Lathyrus tenuifolius*, *Heracleum angustifolium*, *Silene puberula*, etc., which have been raised to the rank of species. The number of Mints has been raised from five to eleven, but only two of them are regarded as true natives. The name *Mentha arvensis* occurs twice in the list, but as *M. sativa* is given as a synonym of one of them there must be a clerical error in giving an \* instead of a ×. Even this hybrid might have been regarded as native, for in one or other of its numerous forms it occurs so far north as Murray, at least. Linnaeus's name of *M. verticillata* might have been restored for this, seeing that he published it in 1759. It is interesting to note that such rare plants as *Arenaria verna* and *Lychnis Viscaria* still exist on Arthur's Seat, and the latter on the Castle rock as well. *Dianthus deltoides* still occurs in the King's Park, but *D. deltoides* var. *glaucus* has disappeared. The late Mr. John Laing received a medal for finding this variety. The value of the book to beginners is greatly enhanced by the ecological lists of the more important districts, the illustrations showing the various parts of a flower, the forms of inflorescences, rootstocks, leaves, venation, fruits, a copious and excellent glossary, an index of genera, and an excellent map of the three Lothians. The book is less bulky than Hayward's *Botanists' Pocket Book*, and though it lacks the descriptions of the latter, it should prove quite a useful publication to students and collectors.

\* *The Field-Club Flora of the Lothians*, by the Botanical Committee of the Edinburgh Natural History Society. Edited by Isa. H. Martin, M.A., F.L.S. William Blackwood and Sons, Ltd., Edinburgh and London, 1927. Price 5s. net.

## BUYING PATENTED ARTICLES.

THE presence of patented articles and other "gadgets" in seedsmen's and gardeners' catalogues seems to be steadily increasing, and although these often work the wonders they are scheduled to perform, it must be admitted that occasionally they fail to come up to their maker's description. In looking through a few such catalogues, I see special wonder-working hoses, patent mowing-machine accessories, etc.; what remedies does the law give a buyer of these articles if they prove to be useless for the purpose for which they are purchased?

*Caveat emptor*, that is, let the buyer look after himself, is the general rule to be applied in cases in connection with the buying and selling of goods, but, as shown in former articles, to such a sweeping rule as this there are several exceptions. I have also shown that where the buyer makes known to the seller the use to which he is going to put the article, in such a way as to show that he relies on the latter's judgment, and the article is of a kind the seller supplies in the ordinary course of his business, then there is an implied condition that the article sold is fit for the purpose specified.

To this implied condition the statute excepts any article which is sold under a patent or trade name, when, it states, "there is no implied condition as to its fitness for any purpose." What is the meaning of this provision? Until a recent date, it was not quite certain what was the exact meaning of these words in the Sale of Goods Act of 1893. From recent case law, however, the point has been made clearer, and in addition these cases show that a sale under a patent or trade name is (for the purpose of the Act) a less frequent occurrence than one might without consideration imagine.

The position was summed up extraordinarily well in a recent case on the subject. The Judge divided the sale of articles under a patent or trade name into three classes; in some of these a condition as to fitness for a particular purpose would apply, in others—where it was a true sale of such an article for the purpose of the Act—no such condition could be applied.

The first case taken was where a buyer asks for an article which will fulfil a particular purpose, and in answer to his request the seller sells him an article by a well-known trade name: here the provision does not apply and the article must be fit for the purpose specified.

Secondly, there is the case where the buyer goes to the seller and says: "I have been recommended such and such an article, will it suit my particular purpose?" The buyer mentions an article by a patent or trade name, and states the purpose for which he requires it. If the shop-keeper sells him the article without more ado, again apparently the proviso does not apply; it is not a sale under a patent or trade name for the purpose of the Act.

And, thirdly, and lastly, where the buyer says to the seller: "I have been recommended so and so"—giving a patent or trade name—"as suitable for the particular purpose for which I want it. Please sell it to me." Here the proviso does apply, and should the article so purchased prove unsuitable, the buyer cannot complain. Harold Sharman.

## VEGETABLE GARDEN.

### FORCING SEAKALE.

I HAVE been interested in the correspondence on the above subject. May I describe still another method of forcing Seakale?

I had a stage built over a Robin Hood boiler, about eighteen inches above it, and on this a box was made ten feet long, two feet six inches wide and two feet deep, with lids in two feet sections, all made to fit perfectly so as to exclude the light. About fifteen inches of old leaf-mould was placed in the box. In November, I inserted the first batch of crowns, making holes with a dibber, so that the sets were just clear of each other. The crowns were

RANUNCULUS LYALLII IN THE DUNEDIN BOTANIC GARDENS.

well watered and the covers placed in position. So soon as this batch started and the plants had grown about an inch or so, another batch was put in, in the same way as the first, and after the second had started, a third was inserted.

When the first heads were all cut, the old roots were pulled up, and new crowns placed in the same soil, which is never changed, and watered in. Successional batches are placed in the forcing box right through the season, so that we always have Seakale ready for use, and some coming on from Christmas till the end of April, when we obtain a supply from the plants in the open, covered by old carbide tins.

There is still another method of forcing this plant. This last season I wanted Seakale in quantity. I dibbled the crowns in the soil of a border in a Melon house, watered them in and left them till next day before covering them. An important detail in this method is to have the soil dry on the top. Previous to this, I collected a quantity of Oak and Beech leaves and dried them on the boiler; it is very important to have the leaves dry. The Seakale crowns were covered with the leaves to a depth of eighteen inches; this thickness of leaves is necessary to exclude the light. As the Seakale head grows, it pushes its way amongst the dry leaves, and when cut is perfectly blanched.

I put 150 crowns in the first batch, and when the produce was cut, it weighed 50 lbs., and I sold the heads in the open market at 9d. per lb. I worked the crowns in batches of 150 all through the season, and had good results without much trouble. The leaves must be very dry, for if damp, they lie too closely and cause the Seakale shoots to rot at the tips.

Seakale forcing is a very simple operation, provided only a little warmth is used; 55° to 60° is sufficient. *N. Molyneux, Rooksbury Park, Wickham, Hants.*

## HOME CORRESPONDENCE.

***Tropaeolum tuberosum*.**—In reply to *P. M. T.*, *Hereford*, p. 360, my experience of *Tropaeolum tuberosum* may be of some interest to him. When living in Jersey many years ago, tubers of this plant were given to me. Even there they bloomed late and sparsely. A few years later, I saw the plant in South Devon—about August, I think—and there it was flowering profusely. Again, in Ayrshire and also in Wigtownshire, in high summer, I saw it on cottage walls flowering lavishly. I remember my friend the late S. Wyndham Fitzherbert, was of the opinion that there were two forms of this species, and I think that *P. M. T.*'s, and my own experience, proves it. It is curious that in both experiences the early-blooming variety was seen both in East and West Scotland, the late form in the south! *C. M. B.*

**The Germination of Celery Seed.**—Has the treatment of Celery seed, as recommended by the Ministry of Agriculture for the eradication of disease, any effect on germination? Treated seeds procured this season have germinated very slowly. A few seedlings appeared after a normal period, others at intervals, some after several weeks. This occurred with three varieties of Celery and a variety of Celeriac. The germination of seeds from two other sources was normal. The whole of the seedlings, at the time of writing, are healthy. If the treatment of the seeds is effective in warding off the disease, the possible retarded germination will be fully compensated. *C. Ruse.*

**Deterioration of Strawberry Plants.**—I was very much interested in Mr. A. J. Hartless' remarks on Strawberries (p. 358). I fear that unless something is done to check the trouble, the growing of Strawberries in this country will soon be impossible. I know of several noted gardeners in this county whose Strawberries are affected with the complaint referred to by your correspondent and have secured new stock with no good results. The plantations in these gardens are affected, although, until last season I boasted of the constitution of my stock; the foliage of the plants was strong and vigorous. The plants in the bed referred to above were obtained

from this robust stock, but to my surprise, after being planted out in well prepared soil, the runners gradually became brown and dried up, just as if the plants were injured by hot water. I am inclined to agree with Mr. Hartless that the introduction of new stock will not solve the problem, even if planted on ground that has not been used for growing Strawberries for several years. I hope other readers will give their experiences of this disease, and also what means they have adopted to keep their stock clean and vigorous, and whether they have been successful. *T. Pateman, Broomfield Hall Gardens, Hatfield.*

**Gladiolus.**—I trust Mr. Kelway will pardon me for offering one or two comments and corrections to his interesting article on the Gladiolus. While it is true that the first Cape Gladiolus of which we have record was *G. tristis*, there were garden Gladioli long before that day. In the *Hortus cystetensis* of Besler, published in 1613, there are six varieties figured, four of which at least might be called garden plants, particularly that named *Gladiolus narbonensis*

*Brenchleyensis* is of the same origin as the so-called *Gandavensis*. There was thus a considerable amount of work done before Souchet began his work in 1850. His death occurred in 1880, not in 1872, as stated. Mr. Kelway hardly allows sufficient credit to the great work done by Standish in 1860, who should surely be placed as the first of English garden Gladiolus raisers. Over 120 varieties of his raising are recorded in garden papers of the period. It must, therefore, I think, be admitted that the early history and development of Gladiolus owes much to raisers in this country, and it is quite possible that the original starting point, the so-called *Gandavensis*, may have indeed originated here. *Edward A. Bunyard.*

**Problems of Bolting.**—Referring to the article on this subject in your issue of May 28, p. 372, whether bolting of Mangolds belongs to the category of "Mysteries" or not is a matter for argument, but there is no doubt that it could be controlled by practical means. As a boy, I remember my father promising a farmer that if he had more than one "bolt" to the acre,

FIG. 204.—THE KELWAY GLADIOLUS TROPHY AND MEDAL.  
(see p. 405).

flor. purpureo. A spike is shown with nine or ten flowers, and it seems difficult to imagine that this can be one of the European varieties, such as *G. byzantinus*. In any case, we should not, I think, definitely rule out the possibility that Cape Gladiolus may have arrived in Europe before 1745. In dealing with the history of the *Gandavensis* class, Mr. Kelway does, I venture to think, less than justice to the early efforts of English raisers. Van Houtte was only the distributor of this class, and made no claim in his own paper or catalogues of having raised it, and the generally accepted story was that Bedinghaus, gardener to the Duc d'Arenberg, raised it in the famous Enghien Garden from seed sown in 1837, and flowered plants in 1839 and 1840. We must not overlook the fact, however, that Dean Herbert had been raising Gladiolus hybrids from the year 1810, and in an article in *The Gardeners' Chronicle*, March 2, 1844, he states that Mr. Bidwill, also an Englishman, had raised seedlings with the same parentage as the famous *Gandavensis*. It is possible then that the Enghien plant might have been imported from England. We must not also overlook Gladiolus *Brenchleyensis*, raised by Mr. Hooker, a nurseryman of Brenchley, Kent, also said to be a *pauciflorus* and *floribundus* cross which, though called

he would give him a pound apiece for them. In those days every pound of seed was grown from selected bulbs, stored and planted out in spring. Seed sold now is grown in about fifteen months instead of two years, and the old system is only used in growing a limited quantity of seeds for stock. Of course, no grower could meet modern competition with seeds grown in the old style, so that if Mr. Darlington's plan of raising non-bolting stocks proves successful, it may be a more economical way out of the difficulty. *Charles E. Pearson, F.L.S.*

***Lilium regale* seedlings.**—In your issue of April 30, page 302, there is an article by Mr. Grove on the subject of "Lilies and Manure," in which he gives his experience of growing Lily *regale* from seed, and states that he sowed the seeds in the beginning of March, in the open, and that some of the seedlings flowered at the end of eight-and-a-half months from the date of sowing. I have grown several lots of seedlings of this Lily and the plants have never flowered under two years. It would be a great inducement to grow this splendid Lily if it could be flowered in eight-and-a-half months from the time of sowing the seed. Perhaps Mr. Grove would further explain his methods. *W. W. Carruthers, 17, Palmerston Park, Dublin.*

## SOCIETIES.

### IRIS.

JUNE 2.—As a spectacle, the first show of the Iris Society, which was held at the R.H.S. Hall, Westminster, on this date, was a decided success. The hall was well filled with beautiful Irises; there was a large number of new varieties to delight and engross the enthusiast, and the attendance was as large as could be expected in view of the many other functions on the same date. The genial Honorary Secretary, Mr. G. N. Bunyard, enthusiastically welcomed interested visitors, and wholeheartedly congratulated the amateur exhibitors on the excellence of their flowers. The judging was completed before noon. We hope the Iris show will become an annual event, for it was a very attractive show, and it served a most valuable purpose in bringing together the best of the June-flowering varieties of the several sections, and in illustrating the great improvements that have been effected in the flower. We have no doubt that, with the experience gained at this, their first show, the Society will make the few needed improvements, such as indicating on the cards the nature and object of the exhibits. A great many new seedlings were selected "for trial at Wisley," but, as most of them were shown under seedling numbers no useful purpose would be served by describing them. The named novelties are commented upon in our remarks on the exhibits in the New Seedling Classes.

#### COMPETITIVE EXHIBITS.

In the eight classes open only to amateurs, Mr. B. R. LONG, Richmond, Surrey, was a particularly successful exhibitor. Mr. LONG may well be termed the "dark horse" of the Iris world, and we believe that this was the first time he has ever exhibited. Not only did he show magnificent spikes of a great variety of Irises, but, with the aid of Mrs. LONG, he set them up admirably. Mr. LONG won first prizes for a large group, eighteen spikes, twelve spikes and six spikes, all of bearded Irises, and was also awarded the Veitch Memorial Medal for his large group, as being the best amateur group in the show. His large group, which occupied twenty-five feet run of tabling, was very handsome, and included the following varieties: Isoline, rosy-ameethyst standards and velvety-purple falls, shaded with old rose and lined with gold at the throat; Colonel Candelot, reddish-bronze standards and velvety crimson falls; Ambassadeur, reddish-violet standards and deep velvety chestnut falls; Madame Choubaut, creamy standards, shot with yellow and ruby, and creamy-white falls edged with lilac; Mdle. Schwartz, a very tall spike of pale mauve flowers. Sir WILLIAM LAWRENCE, Bt., Burford, Dorset, was second, and he included Dalila, Eldorado and Iris King, three showy varieties with yellow colouring on the standards; Caprice, reddish-purple standards and falls of a deep tone of the same colour; and Opera, bronzy-purple standards and dark crimson falls, suffused with velvety violet. Mr. G. P. BAKER, Sevenoaks, was third in this important class.

In the class for a medium-sized group of bearded Irises, the first prize was awarded to Mr. G. L. PILKINGTON, Woolton, for a collection which included Amber, Fro, Moonlight, Dusky Maid and Quaker Lady. This collection was also awarded the Silver Medal of the American Iris Society.

The first prize exhibit in the class for a group of bearded Irises, arranged on eight feet run of tabling, reached a high standard of merit, and the first prize was awarded to Mr. C. W. CHRISTIE-MILLER, Sonning, for a splendid vase of Prosper Laugier, coppery crimson standards and very broad falls; Souvenir de Madame Gaudichau, a tall spike of deep purple bicolor flowers; Ambassadeur, of high quality, and Mrs. Alan Gray, of delightful lilac tone, lightly shaded with pink. Mr. PILKINGTON, who was second in this strong class, had very good vases of Abenda, Alcazar and Trojana. Mr. LONG's first prize exhibit of eighteen spikes of bearded Irises was excellent. He included Flamenschwert, bright yellow standards

and crimson-maroon falls, edged with yellow; Imperator, J. B. Dumas and Edward Michel, of very high quality. Sir WILLIAM LAWRENCE, Bt., was second and LADY ELPHINSTONE, Worplesdon, was third.

The same high quality was shown by Mr. LONG in his first prize exhibit of twelve spikes, and here he included Mady Carriere, Mrs. Stafford, Red Denis and Ambassadeur. Mr. PILKINGTON was second, and Mr. W. ALLISON, Wimbledon, was third. Chief amongst Mr. LONG's first prize six vases were Mons. Cornault, Mdle. Schwartz and Madame Durand. Mr. A. J. BLISS, Tavistock, was second, and he included Bruno, Opera and a couple of good seedlings. Sir WILLIAM LAWRENCE, Bt., had the best three spikes of any one variety of bearded Iris.

The class for three spikes, each of three Irises other than bearded, was not quite so popular as the others. Sir WILLIAM LAWRENCE, Bt., was first with Tenax, a beautiful Californian Iris, Forrestil and Bulleyana. Mr. JAMES PEECH, Cautley Park, was awarded the second prize for vases of Luna and Terpsichore, two beautiful Irises of Susiana type, and Hoogiana, a soft lavender Regelia Iris.

The class for six vases of Iris sibirica varieties was well represented. Mr. C. W. CHRISTIE-MILLER was first with a good collection, which included Snow Queen, Emperor and orientalis. Mr. G. YELD, Gerrards Cross, who was second, had beautiful vases of Emperor and Perry's Blue. Mr. R. E. SPEAR, Bagley Wood, was awarded the first prize for six excellent vases of bulbous Irises. Mrs. FITZUGH was awarded the first prize for a pleasantly arranged "collection of species and/or varieties." Lt.-Col. C. HOARE GREY, Hocker Edge, Cranbrook, who was second, had good vases of I. Tenax, I. Purdyi, I. sibirica and I. orientalis.

There was a good array of new seedling Irises for open competition. The best six bearded varieties were shown by Mrs. W. R. DYKES, who had Cupano, an immense flower with satiny-mauve standards and long, purple falls; Britoness, a large, loosely-made pale yellow flower with a golden beard, and Akbar (see Fig. 196), metallic purple lined standards and velvety-purple falls. The other three flowers were very beautiful, but unnamed. Messrs. G. BUNYARD AND CO. were second with very good seedlings. The best three new seedling bearded Irises were shown by Messrs. R. W. WALLACE AND CO., who had a fine flower of Rajah, with purple standard and velvety purple falls which are lighter in colour at the edges. Their other two flowers and the second prize exhibit of the ORPINGTON NURSERIES were unnamed. The prize winning spikes of one seedling bearded Iris were not named. Mrs. DYKES was first, Messrs. G. BUNYARD AND CO. and Mr. F. BURTON, Hildenborough, were placed equal second.

Mr. AMOS PERRY had the best new seedling Irises other than bearded. His three were Chryso-for delicata, a pretty little hybrid between I. chrysographes and I. Fortunei; Te-bracteata, derived from I. Tenax and I. bracteata, and Purdyi alba. His first prize single variety was I. hybrida Margot Holmes, a rich, rose-purple flower obtained by crossing I. chrysographes and I. Douglasiana.

#### NON-COMPETITIVE EXHIBITS.

Messrs. BARR AND SONS arranged a very large collection, chiefly of bearded Irises, but the other types were also well represented. Their chief varieties were Dalila, Eldorado, Caprice, Mount Penn, variegata aurea, Ossian, Crepuscle, Opera, Miss Maggie, Lorely, Porcelain, Gagus and Her Majesty.

Along the front of his interesting group, Mr. AMOS PERRY had vases of the beautiful little flowers of I. sibirica, I. Tenax, I. Virginica purpurea, I. Spuria pallida and I. Purdyi. His bearded varieties included some good pallida seedlings, Mrs. Hardy, Korus, Duke of York, George Yeld, Lord Lambourne, Mrs. W. Cuthbertson and Abenda.

Many seedlings of merit were included by Messrs. R. W. WALLACE AND CO. in their well-arranged exhibit. Their named sorts included Olympicus, Mrs. Tinley, Ivory, Sir Galahad and Prospero. Against the wall, Messrs. WATERER, SONS AND CRISP had a boldly arranged

group of such sorts as King of the Irises, Magnifica, Flaming Sword, Ambassadeur, Prospero and Dalila.

A large collection set up by Messrs. G. BUNYARD AND CO. included various Iris sibirica varieties, I. Tenax and seedling bearded Irises of merit. The chief named varieties were Sirius, Ambassadeur, Duke of Bedford, Corida, Romany, Nagara and Swazi. Messrs. LOWE AND GIBSON showed Hilda, Clematis, Quaker Lady, Dora Longdon, Blue Bird, Margaret Moore and other valuable sorts.

Mr. G. REUTHE had a pleasantly arranged group which included Gracchus, Cretonne, Contemplation, Bruno and Her Majesty. The ORPINGTON NURSERIES, in a large collection, gave prominent places to vases of Sir Michael Foster, Romola, Swartara, Neptune, Seminole, Lorely, White Knight, Rosalba, Iris King and Dream.

In the annexe, there were interesting paintings of various Irises, shown by Sir MARK COLLET, Mr. F. H. ROUND and Mr. W. J. CAPARNE.

### WAKEFIELD AND NORTH OF ENGLAND TULIP.

THE ninety-first annual exhibition of the Wakefield and North of England Tulip Society was held on May 21, 22 and 23, at the Brunswick Hotel, Wakefield. At the opening of the exhibition by Mr. Watmough, the President, Mr. C. W. Needham, stated that the show was the best they had held for many years. This Wakefield exhibition, he said, was probably the only surviving Tulip show in England, except for the National Tulip Society's show. It had existed for at least 150 years, although the records only went back to ninety years.

For the seventh year in succession Mr. Needham won the Silver Challenge Cup for the best stand of nine Tulips, and he also won the prize offered for the premier breeder with Daphne.

Mr. C. J. Fox, of Mosley, was second, and won the first prize for the premier flamed and the premier feathered varieties with King of the Universe and Lord Frederick Cavendish, respectively. Mr. GERALD W. BENTLEY, of Castleton, near Manchester, was third. Mr. NEEDHAM also excelled in the class for six breeders, dissimilar, in which Mr. GERALD W. BENTLEY was second and Mr. FRANK FOX, third. Mr. C. J. Fox excelled in the class for a pair of flamed Tulips, showing Sam Barlow and Annie McGregor. This gentleman also excelled in the class for a pair of feathered Tulips, with Adonis and Lord Frederick Cavendish. Mr. C. W. NEEDHAM was second in the latter class with the varieties Mrs. Collier and William Wilson. In the local classes, Mr. ROBERT ROBINSON, of Horbury Junction, had the best pan of six rectified Tulips, dissimilar, in which class Mr. S. F. RICHMOND was second. The latter gentleman excelled in the class for six breeders, dissimilar. The first prize in this, as in the similar open class, included six bulbs of Lilium longiflorum (Harrissii) offered by the Bermuda Department of Agriculture.

For the best pan of three breeders, dissimilar, Mr. E. H. ROBINSON was placed first with bizarre, Gleam, bybloemen, Lucy Luard and rose, Annie McGregor. Mr. R. ROBINSON was second, and Mr. W. ROBINSON, third. In the class for one breeder, one flamed and one feathered Tulip, all of one colour, Mr. R. ROBINSON excelled with bybloemen, Columbine, breeder, Duchess of Sutherland, flamed, and Lilian, feathered; Mr. W. ROBINSON was second. In the single bloom local classes, Mr. F. Fox won the first prize for a bizarre breeder with Gleam, and a rose breeder with Annie McGregor; Mr. S. F. RICHMOND for a bybloemen breeder with Lucy Luard; a bizarre flamed, with Sir Joseph Paxton; a bybloemen, flamed, with Trip to Stockport; a rose, flamed, with Mabel and a rose, feathered, with Mrs. Douglas Fox. In the class for a bizarre, feathered, Mr. I. HEWITT was first with William Lee; and for a bybloemen, feathered, Mr. R. ROBINSON excelled with William Annabel. Mr. W. ROBINSON was first in the "Novice" class with Sam Barlow, Trip to Stockport and Annie McGregor, his specimen of Sam Barlow being adjudged the premier bizarre, flamed flower.

## ROYAL HORTICULTURAL.

JUNE 8 AND 9.—Seeing that it followed so closely upon the Spring Show at Chelsea and was in Whitsun week, this was a larger show than might have been expected. The hall was well filled with bright floral exhibits, but the attendance was only moderate. Sweet Peas, Irises, Roses and seasonable border flowers were well shown and the Floral Committee recommended one First Class Certificate and nine Awards of Merit to novelties, and selected two Delphiniums for trial at Wisley. While the exhibits of Orchids were not large, they included many beautiful plants.

## Orchid Committee.

**Present:** Sir Jeremiah Colman, Bart. (in the chair), Hon. H. D. McLaren, Mr. Gurney Wilson (Secretary), Mr. S. W. Flory, Mr. Robert Paterson, Mr. John Cowan, Mr. A. McBean, Mr. H. G. Alexander, Mr. A. Dye, Mr. T. Armstrong and Mr. Frederick J. Hanbury.

## FIRST-CLASS CERTIFICATE.

*Miltonia Princess Mary, Westonbirt var. (Hyeana × Bleuana).*—From Messrs. H. G. ALEXANDER, LTD., Westonbirt, Tetbury, Gloucestershire. A very attractive flower, of large size. The sepals are lightly suffused with crimson, and the petals heavily flushed with similar colour; the labellum also has some crimson tinting, but the distinguishing feature is the reddish mask and radiating lines. The plant bore two spikes, each with three flowers.

## AWARDS OF MERIT.

*Miltonia Kennie, Westonbirt var. (Venus × rexillaria).*—From Messrs. H. G. ALEXANDER, LTD. A pleasing hybrid with a spike of four flowers; the colour is rosy-mauve, the labellum with crimson blotching and radiating lines arranged on a somewhat lighter ground.

*Burrageara Windsor, var. purpurea (Oncidioda Cooksoniae × Odontonia Firminii).*—From Messrs. BLACK AND FLOREY, Slough. This variety possesses a deeper tint of lilac-rose than in the previous ones shown. The labellum is of solid rose-purple, with a bronze coloured disc near each shoulder. The inflorescence was about four feet in length and bore many flowers of a graceful and decorative nature.

*Odontoglossum Ascania Stamperland var. (Antinous × Georgius Rex).*—From ROBERT PATERSON, Esq., Stamperland, Cathcart, Glasgow. An attractive hybrid with an erect spike of six flowers, rather larger than usual, and coloured golden-yellow with red-brown blotching; the broadly-formed labellum is cream-white with yellowish shading.

## CULTURAL COMMENDATION.

To *Laelio-Cattleya Canhamiana alba, Stonehurst var. (C. Mossiae × L. purpurata).*—From ROBERT PATERSON, Esq. A grand specimen of this well-known Orchid. The plant bore five spikes with a total of eighteen large flowers; the sepals and petals are pure white, the labellum rich purple.

## GROUPS.

Mr. JOHN EVANS, Colwyn Bay, North Wales, had a well-arranged exhibit of choice hybrids, including a richly-coloured form of *Miltonia Bleuana*, several pretty varieties of *Odontoglossum amabile*, *O. Seraphis*, purple-red; *Odontioda Hanmerae*, crimson-red, and the attractive *Cattleya*, J. P. Walker. *Cypripediums* were a special feature and included *C. Curtisii Sanderac*, *C. Lawrenceanum*, with six flowers, and half-a-dozen well-flowered examples of *C. Enchantress*, with flowers of an artistic emerald-green colour.

Messrs. CHARLESWORTH AND CO., Haywards Heath, had an interesting group, in which the curious *Bulbophyllum longisepalum* and the tall, *Dendrobium Dalhousieanum* came in for appreciation. *Miltonia* hybrids were well-shown, also some reddish *Odontiodas*, *Cattleya Mendelii var.* The Queen, a pretty white flower, and a varied selection of *Odontoglossums*.

Messrs. STUART LOW AND CO., Jarvisbrook, Sussex, made a feature of *Laelio-Cattleya*

*Aphrodite*, of which a distinct variety bore eight large flowers. There were also examples of *L.-C. Canhamiana*, and pretty forms of *Cattleya Mossiae*. An old-time plant was shown in *Selenipedium grande*, while a special attraction was *Bulbophyllum virescens*, with its curiously formed umbel of greenish flowers.

Messrs. SANDERS, St. Albans, showed the pleasing *Renanthera Imschootiana* in their group, along with *Maxillaria tenuifolia* and the scarce *Cleisostoma lanata*. *Dendrobiums* were well represented by *D. infundibulum* and *D. Dalhousieanum*. *Laelio-Cattleya Aphrodite* and *L.-C. Isabel Sander* both have white sepals and petals, while the central area of the group was attractively arranged with *Bletia Shepherdii*.

ROBERT PATERSON, Esq., Cathcart, Glasgow, exhibited *Odontioda Cornelia*, blood-red, the attractive *Miltonia Lucia*, and *Vuystekeara Aspasia*, with varying crimson tints.

## Floral Committee.

**Present:** Section A.—Mr. Henry B. May (in the chair), Mr. J. F. McLeod, Mr. Arthur Turner, Mr. Wm. Howe, Mr. J. M. Bridgeford, Lady Beatrix Stanley, Mrs. Ethel M. Wightman, Mr. D. Ingamells, Mr. Donald Allan, Mr. E. R. Jones, Mr. R. Findlay, Mr. A. E. Vasey, Mr. George Churcher, Mr. W. B. Gingell, Mr. D. B. Crane and Mr. Charles E. Pearson.

Section B.—Mr. Gerald W. E. Loder (in the chair), Mr. Charles T. Musgrave, Mr. F. R. Preston, Mr. Amos Perry, Mr. G. Yeld, Mr. T. Hay, Mr. E. H. Wilding, Sir William Lawrence, Bart., the Hon Henry D. McLaren, Mr. Reginald, Cory, Mr. R. D. Trotter, Mr. R. C. Nutcutt, Mr. G. Reuthe and Mr. W. B. Cranfield.

## FIRST CLASS CERTIFICATE.

*Meconopsis Baileyi.*—This handsome "Blue Poppy" received an Award of Merit on April 7, 1926, when a plant was shown by Lady Aberconway bearing solitary flowers. Now two, very vigorous plants were shown, and these had beautiful rich blue flowers of slightly different shades of colour on long, axillary pedicels. This is a variable species; Fig. 171 in *The Gardeners' Chronicle* for May 8, 1926, which illustrates Captain F. Kingdon Ward's article on "The Genus *Meconopsis*," shows a somewhat different plant from that shown from Bodnant, and presumably raised from seed collected by Captain Kingdon Ward. The species is again reviewed by the same writer on page 460 of the same year. Shown by LADY ABERCONWAY (gr., Mr. F. C. Puddle), Bodnant, North Wales.

## AWARDS OF MERIT.

*Caesalpinia Gilliesii.*—In favoured places this leguminous shrub, or small tree, will sometimes withstand the winter cold, but it is not generally hardy. A branched little bush growing in a large flower pot was shown, and this bore the characteristic, much divided leaves and dull yellow flowers, with long bright red anthers protruding three or four inches. Shown by JOHN SCOTT, Esq., 56, Nightingale Lane, Balham.

*Deutzia discolor stellata.*—This is a very ornamental variety of the well-known hardy, deciduous *Deutzia*. The long, graceful sprays bear pink flowers. Shown by Lt.-Col. MESSEL, Nymans, Sussex.

*Iris hybrida Margot Holmes.*—A very pretty little *Iris* raised from *I. chrysographes* and *I. Douglasiana*. The flowers are of royal purple colour and the falls have golden lines on the base. Shown by Mr. AMOS PERRY.

*Erica Tetralix mollis.*—The soft, little leaves are covered with down which gives the whole plant a frosted appearance. The plant bore plenty of white, bell-shaped flowers. Shown by Messrs. D. STEWART AND SON.

*Gaultheria oppositifolia.*—This is an uncommon and attractive species from New Zealand where it grows about eight feet in height. The ovate, acute, evergreen leaves are about one-and-a-half inch long and half-an-inch across at the wider part, and are lightly serrated. The waxy white flowers are borne in dense, terminal racemes. Shown by GERALD W. E. LODER, Esq., Wakehurst Place, Sussex.

*Nomocharis sp.*—A small plant bearing a solitary, terminal flower of this Eastern liliaceous plant was shown. The flower was widely expanded. The segments are pink with brown-green centre, and the erect anthers are green. Shown by LADY ABERCONWAY.

*Pyrethrum Marjorie Robinson.*—A beautiful variety which bears large, soft, pink flowers.

*Pyrethrum Scarlet Glow.*—Another splendid variety. The flowers are a glowing rosy-scarlet colour. Both were shown by Mr. HUBERT ROBINSON.

*Zephyranthes Rose of Burford.*—This very pretty Wind Flower was raised from *Z. verecunda* and *Z. carinata*. The rich pink buds open to delicate flowers with pink lines and pink flushing. Shown by Sir WILLIAM LAWRENCE, Bart., Burford, Dorking.

## FOR TRIAL AT WISLEY.

*Delphinium Sir Austen Chamberlain.*—A handsome spike of large, round, lavender flowers which have an outer row of blue petals.

*Delphinium Wedding Bells.*—A very charming variety. It has a tall, well-formed spike of large, round, pale lavender flowers, with an occasional sky-blue petal. Both were shown by Messrs. KELWAY AND SON.

## GROUPS.

Although there were only two exhibits of Sweet Peas, these flowers were the outstanding floral feature of the show, for Messrs. ROBERT BOLTON AND SON and Messrs. DOBBIE AND CO. had very extensive collections of splendid flowers which at once arrested attention and compelled admiration. Not only were these large collections arranged with considerable taste and skill, they were also composed of superbly-grown flowers.

The central place was given by Messrs. ROBERT BOLTON AND SON to a large quantity of Mrs. A. Searles, the vividly beautiful variety which won the Gold Medal at the trials of the National Sweet Pea Society last year. The majority of the spikes of this variety carried five blooms each. Bright colour was also provided by Mammoth, Grenadier and Colorado, while Jessie, Royal Pink, and Miss California well represented the pink varieties. Picture and Cornrade, two cream-pink varieties, and the rich orange-coloured Royal Sovereign were also splendidly shown.

In the equally large collection of fine Sweet Peas so well set up by Messrs. DOBBIE AND CO., the attention of the specialist was drawn to the novelties they displayed. Sunkist is a magnificent cream-ground Picotee variety, with a definite margin; Hero is a glowing rose-cerise flower of great merit. Pnkie, while, perhaps, not everyone's shade of pink, has very good qualities; Prince of Orange, the rich colouring of which we admired at Chelsea, was again shown in good form; Flamingo is a good, deep, pink-coloured variety; while in Camellia and Constance Hinton they showed two good white Sweet Peas.

Interesting collections of Roses were shown by several growers. Mr. GEORGE PRINCE included a large vase of *Rosa hemispherica* in his collection, a rare Rose which bears double flowers of an uncommon shade of yellow. *Rosa Harrisonii*, the Yellow Scotch Rose, *Violetta*, and various garden varieties were also shown. Messrs. GEORGE BUNYARD AND CO. had a small but very interesting collection of old Roses, such as the Apothecary's Rose, *Blush gallica*, *De Meaux* and *Stanwell Perfection*. Mr. J. H. PEMBERTON had *Penzance Briers* and other useful Roses.

A collection of especially well-grown *Streptocarpus* was shown by Messrs. SUTTON AND SONS. The plants were in circles and included rose shades, Giant Blue, Giant White and mixed shades. In another place they showed some very pretty *Calceolaria gracilis* John Innes strain. Messrs. R. AND J. CUTHBERT set up a large collection of well-grown *Tritonia Prince of Orange*. Messrs. J. CHEAL AND SONS had cut flowers of Dahlias, chiefly of the Star and Mignon types.

A splendid selection of his handsome varieties of *Hydrangea Hortensia* was again shown by Mr. H. J. JONES. Messrs. ALLWOOD BROS.

and Messrs. C. ENGELMANN, LTD., staged good collections of Carnations. A large exhibit of herbaceous Paeonies and Delphiniums was made by Messrs. KELWAY AND SON. The former included many beautiful single varieties, such as Queen of the Belgians, white; Lady Ley, blush; Colonel Poe, pink; and Countess of Warwick, a large, blush flower. Chief amongst the double flowered varieties were Queen Mary, pink; Lovely, deep pink; Lady Alexander Duff, blush; and Remembrance, ruby-crimson. The Delphiniums included tall, shapely spikes of Persimmon, Evening, Rosemary and Mrs. H. J. Jones. In a smaller collection of Delphiniums, Messrs. BLACKMORE AND LANGDON set up handsome spikes of Constance, large blue flowers with a white centre, and R. A. Pilkington, an uncommon shade of purple.

A goodly length of tabling was filled by Messrs. LADHAMS, LTD., with seasonable border flowers, including the beautiful garden Pinks of which they have so many good varieties. Large vases of Buddleia globosa and Lavatera Olbia were also included. Messrs. GODFREY AND SON showed well-grown pot plants of Campanula persicifolia Pride of Exmouth.

A collection of miscellaneous border flowers arranged by the CHALK HILLS NURSERY CO. included Lupins, Paeonies, Geums, Irises and a good batch of double-flowered Ryburgh Poppies. Mr. W. J. UNWIN staged a quantity of Iceland Poppies named Coonara Pink, but the colour is not yet fixed, though the exhibit was very pretty.

Messrs. J. R. PEARSON AND SONS arranged a delightful collection of their Lowdham strain of Aquilegias, which embraced many lovely colours. Mr. JOHN KLINKERT had a small collection of Topiary specimens.

Irises, principally the tall bearded varieties, were shown extensively. Messrs. BARR AND SONS had many good varieties, and they also showed Lupinus polyphyllus in named varieties, such as Ruby King, Nelly, a beautiful lilac-shaded spike, and Taplow Purple. They also had various Alliums, including A. albo-pilosum. Messrs. R. H. BATH, LTD., associated their Irises with a good selection of Pyrethrums. Messrs. WATERER, SONS AND CRISP and the ORPINGTON NURSERIES, had good collections. Messrs. STEWART AND SON showed, in addition to Irises, Lupins, Erica cinerea coccinea, Rhododendron fragrans and Richardia Elliottiana.

A very effective display, chiefly of Irises and hardy Ferns, was made by Mr. AMOS PERRY. He also exhibited an interesting selection of Alliums, some splendid double-flowered Gerberas, Lilium philadelphicum and Cypripedium spectabile. In addition to some good Irises, Messrs. WALLACE AND CO. displayed Lilium regale and Rosa Moyesii.

The West Kent strain of Lupinus polyphyllus shown by Messrs. E. J. REDGROVE AND SON included many good colours, and their bordering of the dwarf Veronica Shirley Blue was also very effective. In a well arranged collection of hardy flowers, Mr. F. G. WOOD included the dwarf, floriferous Mimulus Whitecroft Orange with other Musks, and also showed various Primulas and Gazanias. The last-named included the old favourite G. splendens, G. montana and a pretty soft yellow hybrid named Vanity. The Misses HOPKINS had a rock garden planted with seasonable subjects.

An extensive exhibit arranged by Messrs. M. PRICHARD AND SONS included herbaceous Paeonies, Oriental Poppies, Lupins and garden Pinks. Messrs. BAKERS, LTD., showed various Lupins, Primulas, Dianthus and Cypripedium spectabile. In their rock garden exhibit, Messrs. TUCKER AND SONS displayed the beautiful Saxifraga Cotyledon platyphyllum, Primula capitata and other seasonal alpine.

Capt. SYMONS-JEUNE had a most delightfully arranged exhibit of Saxifraga Tumbling Waters. Messrs. MAXWELL AND BEALE planted in their rock garden good batches of Incarvillea Delavayi, Primulas in variety, and dwarf Ericas.

Messrs. G. AND A. CLARK used a good selection of alpine to effect and also showed Lupins Irises and Pyrethrums. Mr. GAVIN JONES had an interesting rock garden exhibit.

In a well-designed rock garden, Mr. CLARENCE

ELLIOTT planted Campanula barbata, Calceolaria purpurea and other uncommon and decorative alpine. At one end of his exhibit he had the pretty Lilium rubellum. A good variety of alpine was displayed by Messrs. W. H. ROGERS AND SON.

#### Fruit and Vegetable Committee.

Present: Mr. J. Cheal (in the chair), Mr. S. Rivers, Mr. George F. Tinley, Mr. E. A. Bunyard, Mr. W. H. Divers, Mr. A. Bullock, and Mr. A. N. Rawes (Secretary).

Reference was made to the honour conferred by the King on Mr. William Lobjoit, a member of the Committee, and the Secretary was instructed to send Sir William Lobjoit a letter of congratulation from the Committee.

The only exhibit before this Committee was Globe Artichoke Gros Camus d'Angersis, a variety with very globular heads and with imbricated scale leaves. The variety is sometimes eaten raw, but cooked heads were sent for tasting, and the quality was exceptionally good. The variety was recommended for trial at Wisley. Shown by Sir WILLIAM LAWRENCE, Bart., Burford, Dorking.

#### Awards to Lachenalias.

THE following awards have been made by the Royal Horticultural Society to Lachenalias after trial at Wisley. The trial was a comprehensive one; it included nearly all the varieties of these plants which have hitherto been named, and the number of seedlings raised by the Rev. Joseph Jacob included in the awards is very remarkable. These seedlings are so beautiful that they constitute a worthy memorial to the discriminating taste and to the energy of the raiser who sent them to Wisley so shortly before he died.

#### AWARDS OF MERIT.

Siam, sent by Messrs. MAUGER; Canada Thibet, Mandalay, Arabia, Calcutta, Tipperary, Leiden, all sent by the late Rev. J. JACOB; and Boundii, sent by Messrs. W. P. BOUND AND SON.

#### HIGHLY COMMENDED.

Goldfinch and Monte Carlo, both sent by Messrs. MAUGER; Africa and Monaco, both sent by the late Rev. J. JACOB.

#### Awards to Aubrietias.

THE following awards have been made to Aubrietias by the Royal Horticultural Society after trial at Wisley.

#### AWARDS OF MERIT.

Vindictive and Carnival, both sent by Messrs. CLARENCE ELLIOTT, LTD.

#### HIGHLY COMMENDED.

Gloriosa, sent by Messrs. M. PRICHARD AND SONS and Messrs. RUYS; Studland, sent by Messrs. M. PRICHARD AND SONS; J. S. Baker, sent by Messrs. BARR AND SONS; Magician, sent by the R.H.S.

#### COMMENDED.

Prichard's A.I., sent by Messrs. BARR AND SONS.

#### Awards to Freesias.

#### AWARDS OF MERIT.

Flowers white.—Giant White, sent by Messrs. F. H. CHAPMAN.

Flowers Yellow.—Orange Tip and Golden Eagle, both sent by Mr. G. H. DALRYMPLE; Treasure, sent by Messrs. VAN TUBERGEN, Messrs. VAN WAVEREN, Mr. G. H. DALRYMPLE and Messrs. J. CARTER AND CO.; Yellow Hammer, sent by Mr. G. H. DALRYMPLE.

Flowers Rose.—Jubilee, sent by Mr. G. H. DALRYMPLE, Messrs. VAN WAVEREN, Messrs. J. CARTER AND CO., and Messrs. VAN TUBERGEN; Apotheosis, sent by Messrs. VAN TUBERGEN.

Flowers Pale Blue.—Wistaria, sent by Messrs. DOBBIE AND CO.

Flowers Lavender.—Orchidea and Fairy, both sent by Messrs. VAN TUBERGEN; Grey Dawn, sent by Mr. G. H. DALRYMPLE.

#### HIGHLY COMMENDED.

Flowers Yellow.—Apogee, sent by Messrs. VAN TUBERGEN and Mr. G. H. DALRYMPLE; Buttercup, sent by Messrs. VAN TUBERGEN, Messrs. J. CARTER AND CO., Mr. G. H. DALRYMPLE and Messrs. MAUGER; Golden Oriole, sent by Mr. G. H. DALRYMPLE.

Flowers Rose.—Mouette, sent by Mr. G. H. DALRYMPLE and Messrs. J. CARTER AND CO.; Youth and Rosebud, both sent by Mr. G. H. DALRYMPLE; Conquest, sent by Messrs. J. CARTER AND CO., Mr. G. H. DALRYMPLE, Messrs. VAN WAVEREN and Messrs. VAN TUBERGEN; Old Rose, sent by Mr. G. H. DALRYMPLE.

Flowers Red.—Red Indian, sent by Mr. G. H. DALRYMPLE.

Flowers Pale Blue.—Bluebeard, sent by Mr. G. H. DALRYMPLE.

Flowers Lavender.—Coeur d'Or, sent by Messrs. VAN TUBERGEN; Twilight, sent by Mr. G. H. DALRYMPLE.

#### COMMENDED.

Flowers Red.—Robinetta, sent by Mr. G. H. DALRYMPLE, Messrs. VAN WAVEREN and Messrs. VAN TUBERGEN.

### ROYAL SCOTTISH ARBORICULTURAL.

#### (ABERDEEN BRANCH.)

WEDNESDAY, May 18, was a red-letter day in the annals of the Aberdeen Branch of the Royal Scottish Arboricultural Society, for on that date twenty-one years ago the branch was founded. To celebrate the anniversary a reception and luncheon was held in the same building, the Douglas Hotel, Aberdeen, where the branch was inaugurated twenty-one years ago. Amongst those present were Colonel J. D. Sutherland, O.B.E., LL.D., Edinburgh, Assistant Forestry Commissioner for Scotland; Mr. J. M. Caie, M.A., B.L., B.Sc. (Agr.), Edinburgh (representing the Board of Agriculture), and Colonel A. D. G. Gardyne of Finavon, Forfar (representing the Landowners' Co-operative Forestry Society). Mr. John Michie, M.V.O., Kincairn, Aberdeen, the President of the branch, presided, and was supported by over a hundred members and friends representative of other kindred bodies.

Lieut.-Col. Fotheringham, of Murthly, proposed the toast of the Aberdeen Branch of the Royal Scottish Arboricultural Society. He recalled to his hearers that the branch was the first offshoot of the parent society, and one to which his heart had always gone. The counties of Aberdeen, Banff and Kincardine, the territory of the branch, had always been amongst the most wooded parts of the country, and they afforded great scope for the excursions of the branch which, he was sure, had resulted in much valuable knowledge being gained in that way of the work of foresters and arboriculturists.

Mr. Charles S. France, F.B.S., Aberdeen, the first Secretary of the branch, a Past President and a veteran who has done yeoman service in the cause of forestry in the north of Scotland, replied. He gave details of the work of the branch, and told of the immense amount of benefit that had accrued, not only to its members but to the cause of forestry in the north-east through its activities.

Mr. Sydney J. Gammell, of Countesswells, near Aberdeen, a leading authority on the subject, gave the toast of "Forestry," to which Colonel Sutherland, Assistant Forestry Commissioner for Scotland, responded. He said the Forestry Commission in Scotland, up to last month, had acquired 232,000 acres of land, of which, unfortunately, less than half was plantable. In the same period of six years they had actually planted 30,000 acres, while private landowners, through Government grants, had been enabled to plant other 36,000 acres.

or a total of 66,000 acres of woodland added to the timber supply of Scotland.

The Chairman, in proposing "The Parent Society," told of the great progress it had made in the face of apathy and even of opposition. By means of excursions, meetings at home and abroad, and by forestry exhibitions, the society had kept the public interest in the country's woodlands from dying out altogether, and they reaped their ultimate reward in the establishment of a Departmental Commission on Forestry in 1902, followed later by the Forestry Commission and the inauguration of Lectureships, followed by Chairs of Forestry at Edinburgh and Aberdeen. The toast was jointly acknowledged by Mr. George Leven, forester, Bowmont Forest, Kelso (a Vice-President of the Society), and Mr. Robert Galloway, S.S.C., Edinburgh, Secretary of the Society.

Professor A. W. Borthwick, O.B.E., D.Sc., F.R.S.E., of the Forestry Chair at Aberdeen University, submitted the toast of "Kindred Societies," and other toasts were "The Northern Branch of the R.S.A.S." and "The Moray and Nairn Foresters' Society."

A pleasing ceremony took place during the proceedings, when the Right Hon. Lord Forbes, of Castle Forbes, Aberdeenshire, presented Mr. George D. Massie, Advocate, Aberdeen, Secretary and Treasurer of the branch, with a gold watch as a token of respect and esteem from the members, and a silver tea service for Mrs. Massie. Lord Forbes said Mr. Massie was not only a most genial companion but a keen and knowledgeable forester.

## TRADE NOTES.

MR. A. HUGHES, general foreman for a considerable number of years with Messrs. R. Wallace and Co., Ltd., Tunbridge Wells, and late of Colchester, has taken over the management of Messrs. V. N. Gauntlett and Co.'s nursery, at Chiddingfold, Surrey.

AFTER nearly twenty-two years' service as a representative of Messrs. Wm. Wood and Son, Ltd., Taplow, Mr. H. Joy, of Dene, Potters Bar, has just severed his connection with that firm. Mr. Joy, who is well-known to hundreds of gardeners chiefly in the south of England has taken this step chiefly because the loss of his wife renders it necessary that he should spend more time at home than the travelling life permits. He parts from the firm and his many gardener friends with keen regret.

A RECENT report of the Recreation Ground Committee of Newport (I. of W.), stated that the cost of horse hire, mower and repairs for the two years previous to the purchase of the Atco Motor Mower was £71 18s. 0d., and for the two years after the purchase of the Atco motor mower it was only £30 14s. 5d. A direct saving of over £30 was therefore effected, and even allowing £10 per annum for depreciation of the Atco, the cost would still be less than formerly. In 1923-4 the cost of horse and hand mowers averaged £36 per annum, and since then, that is, since the Atco came into service, the average cost of mowing had been £16 per annum. Messrs. Charles H. Pugh, Ltd., the manufacturers of the Atco motor mower consider £10 per annum for depreciation is quite unnecessarily excessive, owing to the service facilities that are provided by the manufacturers in order that Atco motor mowers shall not depreciate at anything like the rate suggested. Among recent purchasers of Atco motor mowers may be mentioned the Aston Villa Football Club. Also quite recently the Queen of Norway happened to see an Atco motor mower in service at Sandringham the house of Their Majesties the King and Queen in Norfolk and ordered an Atco motor mower to be dispatched to her residence in Norway. There can be no finer testimony to the efficiency of the Atco motor mower than the fact that it is used in the grounds of so very many prominent people, and if any reader would be interested

to see the Atco motor mower demonstrated on his grass, a postcard addressed to the manufacturers will ensure immediate attention. There is no charge whatever made for such a demonstration, and no obligation is incurred. Applications stating the day and time convenient should be addressed to Chas. H. Pugh, Ltd., Whitworth Works, Tilton Road, Birmingham.

ANY of our readers requiring information and advice respecting Patents, Trade Marks or Designs, should apply to Messrs. Rayner and Co., Patent Agents, of 5, Chancery Lane, London, who will give free advice to readers mentioning *The Gardeners' Chronicle*.

## Obituary.

**J. T. Butterworth.**—We regret to record the death, which occurred on May 31, of Mr. J. T. Butterworth, of South Framingham, Massachusetts, U.S.A., a well-known trade grower of Orchids. Deceased was a native of the north of England, and well remembered R. P. Percival, of Southport, after whom *Cattleya Percivaliana* is named. At South Framingham, Mr. Butterworth owned one of the oldest glasshouses in the United States, for it was constructed in 1848. It was in this old-time structure that he cultivated with conspicuous success a large batch of *Miltonia vexillaria*. *Cattleya Percivaliana* remained a favourite with deceased, and he cultivated a large number of this Orchid. Among numerous other Orchids, Mr. Butterworth had a fine collection of *Zygopetalum Mackayi*, the bluish flowers of which are much esteemed in the U.S.A. The interment took place on June 3.

**David Ivey.**—We regret to announce the death of David Ivey, who had been an employee at Caerhays since 1884. When Mr. T. C. Williams decided, in 1895, to take up the breeding of Daffodils as a hobby, he devoted a special piece of ground to their cultivation and placed it under the sole care of Ivey. That this selection was more than justified was proved by the wonderful flowers shown by Mr. Williams at the Truro Show before the War, in fact, Mr. Engleheart himself has often been heard to say that he had never seen better cultivation of Daffodils. Ivey's searching observation and unremitting care never allowed disease or pest to be in evidence. Eelworm and the Narcissus fly were not to be seen in that garden. Of latter years, Mr. Williams had given to him the outdoor propagation of shrubs and raising of seeds, in which he was most successful. He seemed to know better than others not only where, but when, to sow seeds and strike cuttings. He invariably kept slugs and mice under severe control. One of his greatest natural gifts was his complete sympathy with and unerring knowledge of the wants of a plant, which, combined with acute observation, and long experience, placed him among the finest outdoor cultivators of his day. He will always be associated with *Escallonia Iveyana*, which received the R.H.S. Award of Merit in 1926, and narrowly missed winning the Cory Cup offered for the best hardy shrub of the year. Ivey detected this plant, a self sown seedling, among some evergreens where it had been overlooked by the many people who passed it daily! Our deep sympathy goes out to his widow and family and also to Mr. Williams who has lost a trusted employee and a valued friend.

**Thomas Manning.**—We learn with deep regret that Mr. Thomas Manning, for many years manager to the late firm of Messrs. James Veitch and Sons, passed away at his residence in Putney, on June 6, in his ninety-fifth year. The late Mr. Manning had been one of the auditors of *The Gardeners' Royal Benevolent Institution* and had been a supporter of its work for more than sixty years. The funeral took place on Thursday last in Brompton Cemetery.

## ANSWERS TO CORRESPONDENTS.

**CORRECTION.**—*F. L. L.* Owing to a printer's error, the material recommended as a specific for Botrytis was given as a two per cent. solution of calcium bisulphate. It should be calcium bisulphite. Calcium bisulphite is a solution, and, for the purpose described, it is sufficient to take one part by volume of the solution and forty-nine parts of water. The solution is relatively cheap, and is sold by the pound. If the Celery trouble is caused by Botrytis, calcium bisulphite will be useful, but it is possible that the damage is caused by some fungus such as *Pythium*, which is carried in the seed-bed. The only method of prevention is sterilisation of the soil either by heat or by means of a two per cent. solution of formaldehyde. If formaldehyde is used, the soil should be thoroughly soaked with it, covered with sacking for forty-eight hours, and then turned over several times before use. The soil should not be used if any smell of formaldehyde remains. It should be kept under cover and usually a month should elapse between the application of the formaldehyde and the sowing of the seed. This period, however, can be shortened if the soil is heated to drive off the formaldehyde.

**DENDROBIUM PLUMTONENSE.**—*S. J. B.* This *Dendrobium* is a hybrid between *D. Cybele* (var. *nobilior*) and *D. nobile nobilium*, and was first flowered in the collection of the late W. R. Lee, Plumpton Hall, Lancashire, in the year 1911. It is a member of the deciduous section of the genus and succeeds under the treatment usually afforded to *D. nobile* and its hybrids.

**FUNGUS IN CUCUMBER AND BEGONIA HOUSES.**—*H. C.* The fungus received is the *Mycetozoon, Tuligo septica*, sometimes called "flowers of tan." The yellow plasmodium of this species was much better known to gardeners in former times than now, when there were tan beds, but hardly any modern book of reference suggests methods of getting rid of it. The stage of the fungus as received was a burst sporangium showing a colossal number of smooth, round, violet spores; indeed, there were literally millions of them. Remove the sporangiums before they burst, and disinfect the immediate surroundings with sulphide of potassium.

**LAUREL LEAVES DISEASED.**—*A. C.* The damage to the Laurel leaves is due entirely to the sharp frosts at the end of April.

**NAMES OF PLANTS.**—*B. P., Claygate.* 1, *Euonymus europaeus*; 2, *Prunus Padus*; 3, *Lycium chinense*; 4, *Smyrniolum Olusatrum*; 5, *Vicia narbonensis*; 6, *Asplenium bulbiferum*; 7, *Curculigo latifolia*.—*C. M. G., Nemophila Menziesii* variety. — *Swansea.* *Crataegus punctata*.—*M. C.* 1, *Spiraea Van Houttei*; 2, *Rhodotypos kerrioides*.—*G. D. A.,* 1, *Euonymus radicans* var. *microphyllus*; 2, *Rhododendron racemosum*; 3, *Ledum palustre*; 4, *Polygala Chamaebuxus* var. *purpurea*.

**TOMATOS DISEASED.**—*F. L. H.* Your Tomatos are affected by the disease known as "Stripe." This is a bacterial disease, usually contracted from the soil, but sometimes carried in the seeds. Plants which are growing too soft or which have a weak constitution are more susceptible than hard, strong plants. Nitrogenous fertilisers should be omitted for a time, and the plants should be dressed with sulphate of potash at the rate of two ounces to the square yard. One or two applications are usually sufficient to induce a healthy top growth on infected plants. Liquid manure makes plants very susceptible to Stripe, which is usually not very troublesome if the plants are fed with a well-balanced fertiliser containing a high proportion of potash.

REMARKS.—The demand for cut flowers has been fairly good during the past week. Scarlet and white blooms were most in demand for the Whitsun decorations. Carnations and Roses all advanced in price owing to an increased demand for these flowers from the Provinces. Prices for Lilium longiflorum remained as quoted last week, the supplies being equal to the requirements. Richardias (Arums) are now practically over for the season; a few gladioli of the yellow kind are now obtainable. All gladioli are now much improved in quality and they include

a good selection of the Giant and Primulinus types. There is an abundant supply of Spanish Irises, Imperator, blue, being the most plentiful. The newest lines in this department are Pink Ericerion, Nigella (Love-in-a-Mist) and Gaillardias. More Pyrethrums have been on offer during the past week, the double white being most in demand. Doubtless prices for all these flowers will be easier during the next few days.

REMARKS.—Trade during the week preceding the holiday was good and no doubt the promise of fine weather helped matters considerably. English forced Grapes are more plentiful and prices have reached an easier level. Strawberries are also cheaper, due to larger consignments. Peaches, Nectarines, Figs and Melons are a good trade, although their prices are rather high. Cherries from France are selling well, if in sound condition. Apricots from Spain increase in quantity almost daily, but the quality so far this season is poor. Apples from Australia and New Zealand are selling satisfactorily and generally are in good condition. A few Grapes are arriving from South Africa and some Pears from Australia; both are popular with buyers. Tomatoes sell fairly well and supplies are heavy. The Cucumber trade is steady and prices are holding well. Mushrooms are still in heavy supply, but their prices are fairly good. Forced Peas are a drag on the market now that outdoor Peas are available. French Beans are quoted lower after a spell of comparatively high prices. New Potatoes from Jersey, France and Spain are a rather better trade for the moment. Salads are not in such demand, as might be expected, and their prices are, on the whole, low. A moderate business is being done in green vegetables.

## GLASGOW.

The conditions prevailing in the cut flower market were more encouraging during the past week, and as business reflected a better tendency, prices made some improvement in places. Ordinary English Irises sold at 4d. to 7d. per bunch, special Imperator, King of the Whites and King of the Yellows, 1½ to 1½. Pyrethrums realised 2d. to 4d. per bunch; Sweet Peas, small, 5d. to 7d.

medium, 7d. to 10d., and large, 10d. to 1½; Gladiolus The Bride, fetched 7d. to 1½ (12's). Prince of Wales, red and salmon, 1½ to 2½ (6's); double white Narcissus 6d. to 7d.; Anemones, 2d. to 6d.; Marguerites, 1d. to 3d.; Lilium longiflorum (Harrisii), 3½ to 3½; Carnations 3½ to 4½ per dozen; pink Roses, 3½ to 3½ per dozen, red and white Roses (small), 2½ to 2½.

Bedding plants continue to be plentiful. Gladioli were worth 1½ to 2½ per box; Lobelia, 2½ to 2½; Stocks, Asters and Antirrhinums, 1½ to 2½ per box; Violas 2½ to 2½ per dozen; Coltness Gem Dahlia, 2½ to 4½ per dozen, and Paul Crampel Pelargoniums, 6½ per dozen.

The fruit market was quietly steady. Cheddar Strawberries made 2½ to 2½ per lb., French, 1½ to 1½; Cherries realised 14½ half-bushel; Melons, 4½ to 5½ each; Gooseberries, 4d. to 6d. per lb.; Apricots, 8½ to 9½ per crate; Grape Fruit, 32½ to 36½; Blue Goose brand, 40½ to 42½; New Zealand Apples (Jonathan and Delicious), 16½ to 17½ per case; Palermo Lemons, 16½ to 30½, and Naples Lemons, 27½. The prices of Oranges were unchanged. Tomatoes were cheaper on increased supplies; Scotch Tomatoes made 1½ to 1½ per lb., English and Guernsey, 10d.

In the vegetable section Cucumbers realised 4½ to 7½ per dozen; Cauliflowers, 4½ to 4½; Lettuces, 3½ to 4½ per crate; Madeira Beans, 6½ to 7½ per box; and Tenerife Potatoes, 15½.

## Abstract Published.

## Seed Disinfectants.

Patent 267,968 describes a method whereby  
seeds, including seed Potatoes, are disinfected  
before planting by immersing them or sprinkling  
with a colloidal solution or suspension in water  
of an active disinfectant together with a colloidal  
material, the inventors being Messrs. E. I.  
Du Pont de Nemours & Co., of Wilmington,  
Delaware, U.S.A. Inert non-colloidal diluents  
or coating materials may also be added. Accord-  
ing to examples suitable mixtures are:—  
mercurized p-nitrophenol and kaolin; hydroxy  
mercury chlor phenol, bentonite, and calcium  
sulphate; corrosive sublimate, bentonite,  
and calcium sulphate; copper carbonate  
and bentonite; p-formaldehyde, bentonite,  
and calcium sulphate; mercurized toluidine,  
bentonite, and calcium sulphate. Other dis-  
infectants referred to are mercurized derivatives  
of phenol, cresols and naphthols; other colloids  
are potter's clay, gelatin, glue, casein, and agar-  
agar; other inert diluents are fuller's earth,  
diatomaceous earth, hydrated lime, calcium  
carbonate, and dolomite. Seed Potatoes may  
be treated immediately after cutting. Refer-  
ence is made to a known preparation made by  
precipitating a solution of an organic mercury  
compound containing a protective colloid with  
an organic solvent which is mixable with water,  
and to a preparation made by mixing thiourea  
with a protective colloid in the dry state and  
then gradually adding water to produce a  
colloidal suspension.

## SITUATIONS WANTED

Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this reduced rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.

### SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter, or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.

### PRIVATE.

GARDENER, or GARDENER-BAILIFF—Mrs. Fitzhugh highly recommends her Head Gardener as above; life experience, 10 years present situation; age 46.—E. SLADE, Plas Power Gardens, Wrexham.

10 a.m. Bar. 30.3. Temp. 62°. Weather, Fine.

## The Origin of Cultivated Plants.

SINCE the classic work of de Candolle there have been few works of importance dealing with the origins of cultivated plants. Last year, however, Professor Vavilof, published\* a comprehensive contribution to the subject which is remarkable not only for the novel method which he uses in his quest of origins, but also for the practical conclusions which he reaches. Professor Vavilof sets out from the now generally accepted view—which he himself has done so much to elaborate—that a species is or may be composed of a series of forms which stand in some measure in regular relation

with one another. These forms have, of course, each a certain range of distribution, and the species of which they are members has equally, of course, a range so wide as to cover all the individual sub-species. Applying these ideas to the problem of origin, Vavilof concludes that the simple methods which de Candolle employed are by no means satisfactory. To infer a place of origin of a given kind of cultivated plant from the occurrence in a certain locality of wildings of that species, or of wild, related species, is of doubtful validity, for both the cultivated and the wild plants may have come into that district from another. In illustration of simultaneous migration of cultivated and wild members of a species, Professor Vavilof points out that large numbers of cultivated plants—those which in his classification are placed under the category of secondary crops—are plants which were originally weeds. They introduced themselves as weeds into the Wheat, or other primary crop, and, long disregarded or regarded as a nuisance by primitive cultivators, they at last established themselves in their estimation as crops worth cultivating. Rye offers an excellent example. It constantly turned up as a wild plant in Wheat crops, and the farmer tried to get rid of this weed of the Cornfield. To this day numerous varieties of Rye appear among the Wheat-fields of South-west Asia, and they persist—tolerated by the cultivator because they retain the power to shed their "seeds"—being, indeed, only distinguishable from cultivated varieties by this feature and by the brittleness of the rachis. Hence the geographical origin of a given variety of Rye is to be sought in the place whence the Wheat which it accompanies and has shadowed, originally came. Professor Vavilof subdivides cultivated plants into primary—those which were cultivated in very ancient times; and secondary, those which were the weed companions of the primary crops. Examining the primary crops in detail, the author concludes that the most important food plant, Wheat, is composed of some thirteen Linnean species which fall into three groups: soft Wheat (*Triticum vulgare*) with twenty-one chromosomes; hard Wheat (*T. durum*) with fourteen; and one-grained Wheat (*T. monococcum*) with seven chromosomes. He believes that the centre of origin of soft Wheat is to be found in the mountains of South-west Asia, and if so, it is there that the explorer must look for new forms of *T. vulgare*. Hard Wheat, he holds, has its origin in the Mediterranean region—Algeria, Greece and Abyssinia, and *T. monococcum* in Asia Minor. Thus the Wheats of to-day have, on this view, three centres of origin, and the author holds that it is very doubtful whether these three kinds ever had a common ancestor. The origin of cultivated Wheat may, he thinks, well have been multiple and not simple. Secondary crop-plants present a less insoluble difficulty. Thus, in Hemp, wild plants showing transitions toward the cultivated form grow in association with the latter. Formerly regarded as renegades from the ranks of the cultivated, they are now to be looked upon as candidates for cultivation, differing only from the accepted forms by their more ready mode of seed distribution. *Cannabis sativa* is, moreover, a plant of rich soil and would therefore, like the Nettle, edge up into ground beside households where organic refuse is to be found, and in this way would become a follower of human migrations. In the Altai, for example, the whole process of "civilisation" of the Hemp may be traced. There are wild plants; self-sown wildings neighbouring on habitations; self-sown

plants used for Hemp-making purposes; and plants grown as a cultivated crop. The last soon lose their wild self-sowing habit in the course of cultivation. Professor Vavilof recognises five chief centres of origin of our cultivated plants, in each of which the latter may still be seen in most numerous variety and diversity of form. These centres are (1) South-west Asia, the mountains of which were the nursery of the soft and dwarf Wheats, Rye, small-seeded Flax, small-seeded Peas, Lentils, Horse Beans and Asiatic Cotton; (2) South-east Asia, including the mountains of China, Japan, Nepal, etc., which give us naked Oats, hull-less Barley, Millet, Soy Beans, many cultivated Cruciferous plants and several of our fruit trees; (3) the Mediterranean littoral whence come hard Wheat, many species of cultivated Oat, large-seeded Flax, large-seeded Peas, Horse Beans, Lentils, Beets, and many of our vegetables and fruit trees; (4) Abyssinia and adjacent mountains, from which come sundry Barleys and Wheats and certain races of Peas and Oats; and (5) Mexico and Peru, to which lands we were indebted for the Potato, Jerusalem Artichoke, Maize, Tobacco, Sunflower and American Cotton. Multiple and diverse thus are the origins of our cultivated plants—no less multiple and diverse than those of civilised races of mankind. Although the primary origin of a species is lost beyond retrieving in the "dark backward and abysm of time," something may be done, as Vavilof has shown, to pick up traces of the early recruitment of wild plants into the ranks of the cultivated; but the work is difficult and certainly is doubtful. Only by a more detailed exploration of the earth and a more profound study of species may surer knowledge be gained.

## Gardens and Queen Alexandra's Memorial.

We are pleased to hear that considerable success already attends the Queen Alexandra Memorial scheme. In some instances the number of persons visiting a garden on the appointed day far exceeds expectations. At Ham House, for instance, where it was thought that perhaps a hundred visitors might avail themselves of the opportunity of inspecting the beautiful Petersham gardens of the Earl of Dysart, no fewer than 922 came in one day last week, so that £46 2s. has been handed to the fund.

**Harrogate Flower Show.**—A horticultural exhibition will be held in connection with the annual show of the local agricultural society of Harrogate, which is one of the finest shows in the north of England. Harrogate is a well-known "floral centre," and possesses large public parks and gardens. The Society is affiliated to the North of England Horticultural Society.

**The Potato Crop.**—According to the Monthly Agricultural Report of the Ministry of Agriculture, the night frosts of May were generally not severe enough to cause much damage to Potatoes, and early varieties which were cut down by the sharp frosts at the end of April recovered fairly well. Digging will, however, be delayed in consequence. The very early Cornish crops are light, having suffered from frosts and the May drought. Main crops were planted later than usual this year in most cases, and in some districts planting is not yet completed. Heavy land has been difficult to get into condition for planting. Crops have come up slowly, but where up they appear fairly regular. It would appear that over the whole country the acreage of Potatoes is very much the same as last year.

**Inspection and Certification of Black Currant Bushes.**—The Ministry of Agriculture and Fisheries, on the recommendation of its Horticultural Advisory Council, proposes to set up a voluntary scheme of inspection and certification of stocks of Black Currant bushes intended

\*Bulletin of Applied Botany and Plant Breeding, Leningrad, 1926, Vol. XVI, No. 2, p. 248. See International Review of the Science and Practice of Agriculture, No. 2, March, 1927.

for sale. Stocks will be inspected on application, and certificates will be issued for those which are found to be true to type, and also apparently reasonably free from reversion. The issue of a certificate will not imply that the stock to which it relates was found to be free from all disease, but no certificate will be given for any stock which is obviously infested with Black Currant mite or is otherwise obviously unhealthy at the time of inspection. Growers who wish to avail themselves of these facilities should make application to the Secretary of the Ministry, 10, Whitehall Place, London, S.W.1, before the 20th June. A fee of 7s. 6d. per 1,000 bushes will be charged for the inspection (fractions of 1,000 will be charged as 1,000), with additional fees of 1s. for the certificate and 3d. for each copy certificate.

**Chyngton Estate.**—There is now said to be a possibility of preserving the Chyngton Estate, Sussex, which adjoins the Seven Sisters site, for the nation in perpetuity. The trustees of the late Lord Chichester's will, having learnt within the last few days that there is a fair possibility of someone coming forward to purchase on terms which will preserve the essential features of the property, have decided to withdraw it from the market. It was to have been offered for sale on June 13.

**Chrysanthemum Congress in Paris.**—The twenty-seventh annual congress of the French Chrysanthemum Society will take place in Paris from the 26th to the 28th October, and has been arranged to coincide with the important Horticultural Exhibition to be held in Paris at the same time. A number of questions interesting to Chrysanthemum growers will be discussed, and it is expected that the three days of Congress will be well filled.

**An Immune Pear.**—Mr. E. H. Wilson, of the Arnold Arboretum, mentions in the *Bulletin of the Arboretum*, a Chinese Pear species which promises to be of great value to American growers on account of its being practically immune to Pear blight. It is known as *Pyrus Calleryana*, and is a tree of variable size with considerable diversity in the shape of the foliage. It is found in a wild state from Southern Japan and Korea throughout a great part of China. The flowers, which are borne in rounded clusters, are small, with white petals and prominent pink-anthered stamens. The fruit is brown, and about the size of a garden Pea. It was introduced into America through seeds sent to the Arboretum by Mr. Wilson in 1907; it has since grown rapidly, and for several years past has flowered and fruited each season. Many seeds have been sent out for the purpose of raising plants for use as stock on which to graft garden Pears, and if its immunity to Pear blight be maintained, the species will prove a very valuable introduction.

**Paeony Disease Research in America.**—At the annual meeting of the American Paeony Society, held in New York, the Secretary announced that a plan was on foot for the establishment of a research fellowship at Cornell University to provide for investigation into the diseases of the Paeony. It was proposed to conduct a series of studies and experiments to cover a period of four years, entailing an expense of approximately five thousand dollars to the Society, the facilities which would be offered by Cornell University being calculated at a like sum. The matter, however, was referred to a Committee to consider the whole subject of research.

**Japanese Cherries.**—The *Bulletin of Popular Information* of the Arnold Arboretum, Harvard University (May 16, 1927), states that the double-flowered Japanese Cherries are principally derived from two species, *Prunus serrulata* and its varieties, and *P. lannesiana*. The latter is indigenous to the warmer districts of Japan, and its derivatives are not quite hardy in the Arboretum. The greenish-yellow Ukon and the green-striped grandiflora are descended from *P. lannesiana*, and there are many others, some bearing large, single or double white blossoms, others pale pink or almost

white, all of which are fragrant. The Japanese have a great many forms of *P. serrulata sachalinensis*, which is known in New England as the Sargent Cherry, but for all practical purposes they may be reduced to half-a-dozen. *Albopurpurea*, flushed pink changing to white, is one of the best, and so is *Fugenzo*, pink; then there are *Kirin*; the late-flowering, handsome *Kanzan*; *Shogetsu*, pale pink; and *Horinji*, of a more definite pink hue.

**Sir James B. Slade.**—In our last issue we referred, on page 405, to the well-merited honour of knighthood which has recently been conferred on Alderman James B. Slade, of the firm of Messrs. Protheroe and Morris, city auctioneers, whose portrait we have pleasure in reproducing on this page. Sir James has been connected with his firm for nearly fifty-five years, and has been especially identified in the minds of horticulturists with the important sales of nurseries and nursery stock which are a feature of the Cheapside auctioneers. He is an Alderman of the Essex County Council, of which he has

SIR JAMES B. SLADE.

been a member for nearly thirty years, and is also a Justice of the Peace for the County. He was a member of the Urban District Council of Leyton for twenty-five years, retiring in 1920. Upon the granting of a Charter of Incorporation to Leyton in 1926, Sir James was chosen to be the Charter Mayor, and was also elected the first Mayor of the new Borough, a position he still occupies. His firm has been associated for nearly one hundred years with Leytonstone, which is now included in the Borough of Leyton, and which Sir James has seen grow from a suburban village to a town of 130,000 inhabitants. It gives us great pleasure to congratulate him on the honour and distinction he enjoys as a direct result of his many years of honourable and unremitting activity in the cause of horticulture and in public service.

**Australian Fruit Imports.**—The Empire Marketing Board states that during the season the imports of Australian Apples to this country have been 30,000 cases, and New Zealand about 65,000 cases, below the estimated quantities. The total for the season, which is now almost closed, has amounted to 1,221,156 cases and 7,322 half cases from Australia, and 434,932 cases from New Zealand.

**Inventor of the Reaping Machine.**—The centenary of the invention of the reaping machine by the Rev. Dr. Patrick Bell, was commemorated on June 12 in Carnylie Parish Church, Forfarshire, of which the inventor was minister from 1843 till his death in 1869. The service was conducted by the Very Rev. Dr. Norman

McLean, of Edinburgh, Moderator of the Church of Scotland. He said that he could imagine no man who had given so much to the world as Dr. Bell. Dr. Bell was wholly disinterested. He might have been a millionaire, but he never took out a patent for his invention; he left it for humanity to use.

**Sir Daniel Hall.**—We learn that Sir Daniel Hall, Director of the John Innes Horticultural Institution, has resigned the post of Director-General of the Intelligence Department of the Ministry of Agriculture—which he has held since 1920—but will continue to act as Chief Scientific Advisor and Chairman of the Research Council of the Ministry. We published in our issue of August 14, 1926 (p. 121) some account of Sir Daniel's activities in the service of horticulture, on the occasion of his taking up the post of Director of the John Innes Institute.

**Java Coffee.**—The *Journal of the Royal Society of Arts* for May 27 publishes an interesting article on the decline of Coffee-growing in Java. The so-called "Java Coffee"—*Coffea arabica*—was successfully introduced into Java about 1699. This type has few qualities of resistance, and when the leaf disease known as *Hemileia vastatrix* appeared in Western Java, and spread gradually over the island, many plantations were completely destroyed. To-day there are only a few plantations producing the genuine, original coffee, and these are located at an altitude of between 3,000 and 4,000 feet in order to escape the ravages of the pest. The type now most commonly grown in Java is *C. robusta*, which was introduced in 1900, and was found to be resistant to the leaf disease, although it has, in its turn, fallen a prey to a "Borer" known as "*koffiebeesenboek*," which appeared in Western Java about twelve years ago. *Coffea arabica* is still grown in considerable quantities in the outer possessions of Sumatra, Celebes, Bali, and Timor, where the soil and climate are the same as on the island of Java. The total commercial production of Coffee on the island and in the outer possessions is said to have dropped to about fifteen-and-a-half million pounds, as against about 175 millions in 1879.

**The Paris Museum of Natural History.**—The Natural History Museum of Paris is situated in the "Jardin du Roy" and was founded in 1635, so it is of considerable antiquity. The garden is now usually called the "Jardin des Plantes," and its history is bound up with the lives of the botanists who practised there, such as de Jussieu, Brongniart, Thouin, Decaisne, and Van Tieghem. There are nineteen departments in the Museum, besides a chair of organic chemistry and one of applied physics. In the "Galerie Publique de Botanique," bordering on the Rue de Buffon, are paintings and wax reproductions of exotic plants and fruits, types of different forms of fruits and seeds, information on Rubber and the principal vegetal products, preserved plants, photographs giving views of the deserts of Mexico and of South-west Africa, and some vegetable remains found in ancient Egyptian tombs. In the same gallery are wax reproductions of most of the French Mushrooms, and a very interesting collection of fossil vegetable remains grouped in two series, the one following the botanic classification, and the other arranged according to the strata in which the fossils were found. A large collection of specimens of French and foreign woods has had to be put, for want of room to display it, in a part of the Museum to which the public is not admitted. The department of Phanerogamy, which is over the Public Gallery, possesses herbaria which are without doubt among the most interesting in the world; there are nearly 25,000 specimens, and many of them are historic, some dating back to 1558. The Cryptogamic department is at 63, Rue de Buffon, and is devoted to cellular cryptogams (Mosses, Algae and Mushrooms) and to the study of fungous diseases. Here also there are valuable herbaria, in particular those of Montagne, Bornet, Thuret, Cardot, F. Camus, Hue and Gomont. Each autumn a show of Mushrooms and Fungi is held, which always attracts a large number of visitors. The department of Organography

and Vegetal Physiology is at 61, Rue de Buffon ; here biological and anatomical researches are conducted, and there is a collection of nearly 33,000 microscopic specimens covering nearly all genera of Phanerogams and vascular Cryptogams. The Cultivation Department, housed at the same place, takes charge of the preservation, hybridation, and study of living plants, and also covers the introduction and distribution of useful or ornamental species, and the provision of fresh material for researches. The collections of plants comprise about 23,000 species, including plants in the open air and under glass. During the war, the collections which were formerly housed in the great Winter Garden, had to be sacrificed, in particular some beautiful Cycads. The houses are not now open to the public, but they still contain very rich collections of Succulent plants, Bromeliads, Aroids, and other exotic subjects. The open air plants comprise the Fruticetum (useful and ornamental shrubs) classified according to Bentham and Hooker ; a plot of economic and medicinal plants arranged according to their uses ; a botanical garden showing the classification of Brongniart, already superseded ; and beds where the species, varieties, and hybrids considered the best for ornamental purposes of Tulips, Hyacinths, Irises, Gladioli, Pelargoniums, Chrysanthemums, Roses and other hardy plants. The trees are to be found in the Labyrinths, in the Botanic Garden, along the walks, and in the Menagerie ; but as the present quarters are somewhat cramped, and the air is not so pure as in former years, a piece of ground at Chèvreloup, Versailles, 140 hectares in size, has been secured, to which the trees are being transferred. Many of the trees are of great age ; for instance, a *Robinia Pseudacacia*, planted in 1636 ; *Acer creticum*, 1702 ; *Sophora*, 1747 ; and *Cedar*, 1734. The study of the collections and of the best methods of cultivation, hybridation, selection and grafting necessitates a small experimental garden, with a laboratory and herbarium. The Department of Cultivation maintains relations with over 600 Botanic Gardens and 150 private garden owners. It has published, since 1841, an annual catalogue of seeds available for exchange, and in 1926 nearly 12,000 packets of seeds were distributed. Before the war, it was the practice to cultivate useful plants with a view to their introduction into the Colonies ; in this way Coffee was introduced to Martinique in 1720, and Vanilla to Reunion in 1817 ; but now exchanges for overseas countries are limited to buds and grafts, living plants being only sent to French or European correspondents.

**Trials of Onions and Cabbages.**—The Royal Horticultural Society will, during the coming season, carry out a trial of autumn-sown Onions and Cabbages. Seedsmen and growers are invited to send a packet of each variety of these two vegetables which they desire entered for the trials, to The Director, R.H.S. Gardens, Wisley, Ripley, Surrey (from whom the necessary entry forms may be obtained), to reach him on or before June 30, 1927.

**Fruit Exhibition in Leipzig.**—The local Fruit Growers' Society of Leipzig is to stage a fruit show in the town from the 8th to 11th October, 1927. Besides examples of the best fruits there will be exhibits of all kinds of implements, etc., used in fruit-growing.

**Experimental Farm to be Sold.**—About five years ago, Sir Frederick Hiam presented to the National Institute of Agricultural Botany a holding of 355 acres, about two miles from St. Ives, to be used for growing seed corn and demonstrating improved methods of agriculture. The land was farmed by Sir Frederick on behalf of the Institute and is in a high state of cultivation. It has, however, been decided by the authorities of the Institute to sell the farm, and it is to come under the hammer on June 25, at Cambridge.

**Memorial to Berlin Parks Founder.**—On May 27, memorial celebrations, at which many representatives of municipalities and horticultural societies were present, took place in Berlin in honour of the founder of the Berlin

public parks, Herr Meyer. The present Parks Director, Herr Erwin Barth, placed a wreath of Laurel, with the arms of Berlin, on the memorial. In his speech, Herr Barth recalled that Meyer was one of the greatest of German landscape gardeners ; his chief monuments in Berlin were the Humboldtthein and the Treptower Park, and it was due to his enterprise that for the first time playing fields were established in Berlin parks.

**Memorial Garden at Eton.**—In memory of the late Mr. H. E. Luxmoore, for many years an assistant master at Eton College, a fund has been

an account by P. Landau of Germany's oldest garden-poem (written in Latin about 827, and first printed in 1510), and a well-illustrated description by Franz Lipp of wild flowers in America, are among some of the other contents of an attractive issue.

**Appointments for the Ensuing Week.**—**MONDAY, JUNE 20 :** International Commercial Horticultural Conference at Geneva (six days) ; Harrogate and District Horticultural Association's meeting. **TUESDAY, JUNE 21 :** Royal Horticultural Society's Committees meet (two days). **WEDNESDAY, JUNE 22 :** Wadhurst

FIG. 205.—*PAEONIA VEITCHII*.

(see p. 428).

raised by Old Etonians to preserve the garden cultivated by the deceased in its present condition. The land comprising the garden is the property of the Windsor Corporation, and the Council have granted a lease of ninety-nine years at an annual rental of £32.

**"Gartenschönheit" for May.**—The May number of our German contemporary, *Gartenschönheit*, contains as a frontispiece a couple of well-coloured plates of *Azalea Arendsii* and *Rosa glauca rubiginosa forma Dingleri*. A whole page Supplement in sepia tones represents *Cornus florida*, and two coloured garden pictures show a gay children's garden designed by a Cologne firm, and late spring bedding in the Town Park in Hamburg. A sympathetic article on children's gardens by Georg Liebsch,

Gardening Association's show ; Southampton Royal Horticultural Society's show (two days). **SATURDAY, JUNE 25 :** Wallington Horticultural Society's show.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Rhubarb Wine.*—To make this, wait till the Rhubarb is ripe, at the end of June, or beginning of July. Cut it into thin slices, about 8 lbs. to a gallon of boiling water ; cover it and stir it daily for a week, then strain it through a cloth, and add 3 lbs. of sugar to each gallon, which, at 3d. per lb., makes a cost of about 1/- per gallon (loaf-sugar, however, is best). It may then be casked up, or put into large stone bottles, and in six months it will be delicious. *Hardy and Son, Maldon. Gard. Chron., June 19, 1852.*

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Blotchley Park, Blotchley, Bucks.

**Peristeria elata.**—This stately Orchid is known as the Dove Orchid, and is the most popular member of its genus. The plant is a strong grower of terrestrial habit and requires a compost of a more substantial nature than most Orchids. It is usual to repot this Orchid early in the spring, so soon as new growth commences. After they are repotted the plants should be watered very carefully until the new roots have made considerable progress, as there is a danger of the pseudo-bulbs rotting if water is used too freely.

**Compost.**—Two-thirds well-rotted, turfy loam, and one-third fibrous peat mixed with thoroughly decomposed, dry cow manure, provides a most suitable compost. Ample drainage should be ensured by half filling the pot with broken crocks. The compost, having been warmed, should be placed to within an inch of the rim of the receptacle. Pot the plants moderately firmly; the base of the leading pseudo-bulbs should rest on the top of the rooting-material and not be buried in it. When in full growth Peristerias require ample supplies of water at the roots, and especially when the pseudo-bulbs are approaching completion; an occasional watering with weak liquid manure is beneficial to the plants. When the pseudo-bulbs are perfectly matured, the amount of water should be gradually reduced until, in winter, only sufficient to keep the pseudo-bulbs plump will be required. *Peristeria elata* should be grown in a light position in the warm Cattleya house, or in a similar warm structure, all through the year. Black rot or spot disease, which sometimes attacks the pseudo-bulbs, is usually caused by an excess of water, in conjunction with a low temperature during the plants' resting season. *Peristeria cerina* and *P. pendula* are both inferior to *P. elata* as horticultural plants, but are worthy of a place in large collections where room can be found for them.

**Acineta.**—The three or four members of this genus are developing their inflorescences, and need extreme care, for if the plants receive too much water at this stage the spikes may turn black and drop. Like *Peristerias*, *Acinetas* are robust plants, with large pseudo-bulbs, and large, plaited leaves, they produce a stout many-flowered inflorescence that is more or less pendulous. These Orchids are natives of tropical America, and Southern Mexico, therefore they require a high temperature, such as is maintained in the East Indian house. On account of their pendulous inflorescences they are best suspended when in bloom. In other respects their cultural requirements are the same as for *Peristerias* and other allied, terrestrial Orchids.

**Oncidioidas.**—The different bigeneric hybrids of these interesting Orchids of which a member of the *Cyrtorchilum* family of *Oncidium* is a parent, will succeed under precisely the same conditions as those advised for *Oncidiums*. The best-known members are *O. Cooksoniae*, *O. cinnabarina*, *O. Stuart Low*, *O. McBeanianum* and *O. hybridum*.

### THE KITCHEN GARDEN.

By R. H. CROOKFORD, Gardener to THE RT. HON. LORD  
WAVERTREE, Horsley Hall, Gresford, N. Wales.

**Cauliflowers.**—Make provision to maintain a succession of these vegetables by planting suitable varieties, which follow in turn, until quite late in the season, when Broccoli, such as Michaelmas White and Autumn Protecting, should be available. The ground should be well manured for both Cauliflowers and Broccoli, which mature before winter sets in. Care should

be taken that these vegetables do not suffer from lack of moisture during dry weather or the heads will be small. A liberal mulch should be applied along the rows, especially on light soils, while copious supplies of liquid manure will be found very beneficial. Keep a sharp watch for caterpillars which should be picked off the plants or the latter sprayed with Katakilla.

**Broccoli.**—When these plants are ready for transplanting, set out the maincrop on firm ground for winter and spring supplies. Allow two feet six inches between the rows and about two feet between the plants in the rows.

**Kales and other Greens.**—All varieties of Kales, as well as Purple and White Sprouting Broccoli, Savoys, etc., should now be planted out in quantity, as ground becomes available. The land, if in good heart, need only be forked lightly, made firm, and levelled. If of poor quality, dig in a small quantity of well-rotted manure, or lightly fork in a dressing of soot and superphosphate. If possible, plant during showery weather, but if the weather is dry, keep the plants watered freely until they are well established.

**Globe Artichokes.**—These plants should now receive copious supplies of liquid manure; also apply a mulch of well rotted dung, especially where the soil is light and shallow.

**Parsley.**—Make a sowing of Parsley for providing a supply of leaves in autumn. This herb needs to be kept well watered during dry weather. Frequent light dustings with old soot will do much to stimulate growth.

**General Remarks.**—Use the Dutch hoe between all growing crops. Attend to watering, especially all newly planted crops. Place the necessary supports to Peas and Beans in good time as growth is now rapid and shoots easily broken.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to THE EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Peach and Nectarine Trees.**—These trees are making very good growth, especially where disbudding and the removal of surplus shoots have been done carefully. Constant attention is necessary in training the shoots. Young growths should be tied to the shoots from which they are growing to cause them to grow in a straight direction from the base, and this should be done before the wood gets too hard to bend to the position required. As the growth advances they should be tied to Privet twigs or some other means must be employed to keep them straight and safe from injury in stormy weather. On each occasion when the trees are attended to remove any of the young growths that are not required for filling bare spaces and for fruiting next season. Those that remain will thus have every opportunity to develop strength and become well matured by the end of the season.

**Thinning the Crop.**—Trees with heavy crops of fruit, which are now swelling fast, should be duly thinned of some of the crop. First remove the smallest fruits and those badly situated. Trees not making much growth and any that were root-lifted and pruned should only be moderately cropped, but where the new growths are strong and healthy, plenty of fruits may be allowed to remain to ripen. The number of fruits to retain on a tree will depend greatly on the size of the variety. If, at the final thinning, the fruits are evenly distributed all over the trees at a distance of nine square inches apart, when they are fully developed the crop is a very heavy one. I always complete the thinning of the crop before the stoning process. See that the roots are well moistened and trees bearing freely liberally fed. Syringe the foliage three or four times weekly in the afternoons when the weather is bright and warm; this will encourage growth and help to keep down attacks of red spider.

**Strawberries.**—Packing Strawberries to travel safely long distances is not an easy matter, but requires a great deal of care. A good plan is to procure a sufficient number of suitable sized punnets for the purpose, line each with cotton-wool on which place a sheet of tissue paper or very soft leaves. Gather the fruits when they are perfectly dry and a trifle under ripe. Place each berry, when the fruits are quite cool, in a soft leaf and then pack them closely together in the punnet, commencing at the rim. Over each punnet of fruit lay a few soft leaves and a covering of tissue paper. Boxes of suitable depth, lined with soft material, should be prepared, and the punnets of fruits placed in them closely together. Cover the whole with a sheet of cotton-wool and then fasten down the lids of the boxes. Two or more boxes may be tied together for transit, and they should travel well by rail.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Melons.**—As choice hardy fruits are not likely to be over plentiful this season, every available pit and frame should be utilised for the growth of late Melons. I stated in my last notes that bottom-heat was essential to the fruits setting well, and especially to cause them to ripen, but with summer heat, almost anything that will ferment, combined with early closing of the pits or frames, will maintain a temperature suited to the growth of very good Melons. Select varieties which ripen quickly and plant in good, sound loam, free from animal manure. Feed the roots moderately, as what they will lose in size through lack of stimulants will be gained in flavour. The aim of the grower should be to provide a limited root run, ensure all the top and bottom heat available, thin training, liberal syringing with water warmed to 85°, and just enough water at the roots to prevent flagging of the leaves when the fruits are ripening. If the plants are set out on raised mounds, kept dry at the collar, carefully ventilated and thinly trained so that the sun can reach the bed, growth will be wiry and fertile. Such plants will set plenty of fruits which will swell to a good size and ripen satisfactorily.

**Melons in Houses.**—Top-dress plants growing in houses with bone-meal, but do not use animal manure. Feed the roots with tepid liquid guano or weak soot-water on alternative waterings. When two or three fruits promise to swell at the same time, all larger and smaller fruits should be removed and every lateral pinched to concentrate the energies of the plant in the main growth and to prevent the main leaves from becoming crowded. Beginners should be reminded not to remove surplus fruits too early, as a little too much water or a deficiency of bottom-heat sometimes causes the young fruits to turn yellow and die.

**Peaches.**—So soon as the fruits are all gathered on early trees the latter should be syringed frequently to keep the foliage clean, for on this will depend the ripening of the wood and the plumping up of the buds for the next season's crop. If the trees have furnished good crops, occasional applications of weak liquid manure will be found beneficial to them, and do not allow the roots to become in the least dry from now onwards until the leaves drop naturally. Throw the house open night and day, and expose the trees fully; see also that the latter are kept clean. Houses in which ripe fruits are hanging should be kept cool and airy. Examine the trees daily when the fruits are cool, and gather all that are ready; place them in an airy room on a soft surface, keeping each day's picking separate. The ripening of the crop in successional houses may be hastened, if there is likely to be a break in the supply. The night temperature may be raised to 70°, which may now be easily done without the aid of more fire-heat; avoid, however, a moist and stagnant atmosphere.

**Late Peaches.**—The trees in late houses which are swelling heavy crops of fruits should be assisted with diluted liquid manure and artificial fertilisers as required. Keep the foliage clean. Pinch all gross laterals and push the foliage to one side to let the sun reach the fruits to colour them as they approach ripeness, remembering that, as a rule, the higher the colour the better the flavour. The fruits on trees in late houses will now be sufficiently advanced to be thinned finally, and now is the best time to retard the crop, if this is deemed desirable.

## THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Carnations.**—Border Carnations will need staking and tying; the stakes should be as slender as possible, the patent wire supports sold for the purpose being very suitable. Many of the perpetual-flowering Carnations are splendid for furnishing beds out-of-doors and have the advantage of flowering freely throughout the season. These also should receive occasional attention as regards staking and tying.

**Pinks.**—There are many charming varieties of border Pinks; most of them are very useful for forming edgings and for furnishing supplies of cut flowers. Even when out of flower the grey, glaucous foliage is very attractive. They are all easily increased at this time from cuttings or pipings. Shoots from three inches to four inches in length should be inserted in sandy soil in cold frames, or under hand-lights or bell-glasses in the open; indeed, most of the cuttings will root readily in the open if they are kept partially shaded until they form a callus.

**Pyrethrums.**—The many beautiful single and double varieties of the border Pyrethrum are ideal plants for supplying cut blooms. They are very accommodating plants as they may be lifted after flowering, divided and replanted in the reserve garden, thus making room in the borders for summer-flowering subjects. They may be successfully moved again early in the year when they are starting to grow; they should never be disturbed at the roots during the autumn or winter, as this usually results in a large proportion of losses.

**Ponds and Fountain Basins.**—The problem of keeping ornamental ponds and fountain basins free from weeds of various sorts is by no means easy, especially if they are occupied by plants and fish. Some of the stronger-growing water weeds can only be kept in check by constantly cutting or dragging them out. The lower forms of plant life, as represented by various forms of green Algae, may be destroyed by sulphate of copper, the quantity used being 1 lb. to 100,000 gallons of water. The copper sulphate should be placed in a piece of coarse sack and trailed through the water until it is all dissolved. This treatment should not injure Water-Lilies or coarse fish. Lime may also be used for destroying green Algae, and it is best applied by first mixing it with water; it should then be emptied in at various points in the tanks or fountain basins, stirring it about with a broom to ensure even distribution. The cloudy appearance quickly disappears, especially if an extra flow of water can be maintained for a short time.

**Hedges.**—These should be trimmed before the growths become too hard and woody, as the work is then much easier, and more expeditiously performed. Early trimming usually means a second trimming later, but it is really the better and quicker method. Broad-leaved hedge plants should never be clipped with shears; the shoots should be cut out with a knife or secateurs. Hedges are often neglected as regards manuring, with the result that they get thin and bare at the base. Where there is reason to suppose that they are neglected in this respect they should be given a dressing of well-rotted farmyard manure.

## PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN, Brocket Hall, Hertfordshire.

**Zonal Pelargoniums.**—These plants are useful subjects for the decoration of the conservatory during the autumn as they produce bright and variously coloured flowers. Plants intended for winter flowering are now ready for their final potting. The compost should consist chiefly of good, open loam, mixed with a little decayed manure and sufficient grit or silver sand to ensure free drainage. After potting, stand the plants in a slightly shaded place for a short time until it is found that the new roots are active in the soil, when they should be fully exposed to sun and air. Pinch out the tops of the plants to cause side growths to develop and remove all flower buds during the growing season. When the receptacles are well filled with roots a little manurial aid may be given, but not to such an extent as to favour a sappy growth, or the flowers may be somewhat disappointing.

**Francoa ramosa.**—Where old plants of the Bridal Wreath have been grown under cool treatment, they will now be sending up their flower spikes and may require a little more space and air to allow them to do so. The plants may be assisted and the flowers improved by the use of liquid manure. Failing this, a little concentrated plant manure will do quite well, provided it is used with discretion. This plant may be had in flower over a long period by introducing a few plants, at intervals, into a warm greenhouse, while the main batch may be stood out-of-doors under a north wall. The Francoa is by no means tender, and the harder treatment allotted to it will result in finer blooms. This plant may be raised either from seeds or cuttings; the seeds should be sown now and germinated in a cool house.

**Gardenias.**—Young Gardenia plants raised from cuttings this year are ready for their final potting. The compost may consist of loam and peat, with a little bone-meal added, and coarse sand to render the texture porous. Plenty of warmth and moisture are necessary during the plants' growing season, and when the flower buds are visible the roots may be fed liberally with a suitable fertiliser.

**General Remarks.**—Bush Chrysanthemums should be potted as they become ready, also late rooted cuttings which are to be grown on single stems in six-inch pots. It is fatal to starve the plants at this stage; even if manure water is used to keep them growing the growth will be slow when they are placed in their flowering pots.

## FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Greenhouse Plants.**—In the greenhouse the Regal Pelargoniums are now making a bright display. To extend their flowering season they should be well attended to by removing all spent flowers, and regularly supplying the plants with liquid manure or an occasional top-dressing or some approved fertiliser. If green fly or white fly infest the plants they should be fumigated promptly, as both insects are capable of ruining the finest batch of Pelargoniums. For the destruction of green-fly "Auto-shreds" is very effective, and does not injure their flowers or foliage, while nothing seems to deal with white fly so effectively as the new fumigant, Cyanogas. It is most essential for the operator to withdraw from the greenhouse speedily, and lock the door when using this dangerous gas. Two-year-old plants of *Crassula coccinea* are also in flower, and fill the house with their sweet perfume, while their compact heads of rose-pink to scarlet flowers are very showy. These *Crassulas* are harder than is generally supposed, and a few plants placed outside on a dry border have lived safely through the winter here, the foliage having become bronzed and reddened, but the plants promise to flower

well later on. The newer varieties of *Hydrangea Hortensia* are also useful plants for greenhouse display, their bright blue, crimson and pink shades adding variety and colour. As a hanging plant for the warm greenhouse, *Hoya bella* is a splendid subject, as in this position its drooping umbels of waxy, white flowers with crimson centres are displayed to perfection, while their delicate perfume is also much appreciated. Cuttings taken soon after the flowering is over may be rooted in small pots and grown on to furnish similar baskets for another season.

**Tying Peach and Nectarine Shoots.**—The shoots of the current season should be trained in position and any surplus growths which are likely to overcrowd the trees removed. In tying these young growths, endeavour to get them as near as possible into the position they are to occupy when the older fruiting wood has been cut out in the autumn, and at the same time prevent them from shading or bruising the young fruits. As next year's crop depends, to a great extent, on the treatment of this year's young shoots, care should be taken to ensure that they are properly matured, and not overcrowded, or the branches allowed to cross each other at an awkward angle. The stoning stage is often a critical period, and where lime is deficient in the borders the result is shown in the dropping of the fruits, which, on being cut open, show clearly that the stone is not formed properly; fruits splitting open may sometimes be traced to a check, but it is also evidence of a lack of lime, which should be applied to the borders during winter.

**Rock Garden.**—The earlier flowering species are now fast getting over, and the spent flowers should be removed, to prevent the plants developing seed-pods. Where necessary, a top-dressing of suitable compost should be placed around the plants to encourage the development of new growth; this top-dressing also acts as a mulch, and is of great assistance to the roots during dry weather. The scarlet flowers of *Ourisia coccinea* are very pleasing amongst the less rampantly growing *Saxifrages*, and although it is generally recommended to plant this Chilean species in the shade, it seems to revel in a sunny spot, where its creeping roots can almost embrace the stones which form the pocket in which it is growing, creeping round them and forming fresh colonies. *Lithospermum purpureum coeruleum* has also been exceptionally good this season, although it is not generally classed in the front rank even among *Lithospermums*, because of its straggling and sparsely flowered habit. By continuous stopping of its long growths, which root if undisturbed, it may be formed into a fairly compact mound. Such plants have been covered with purple buds this spring, opening later to a deep blue.

**Kitchen Garden.**—All spring-sown Brassicas are ready for transplanting in their permanent quarters. It is sometimes recommended to wait for showery weather and, where watering in the plants is out of the question, this advice may be adhered to, but, as a general rule the planting is more cleanly and speedily performed in dry weather; and if the plants are given a good soaking, the loose, dry surface soil moved by the hoe or cultivator so as to cover the wetted surface, and thus prevent the sun from drawing out the moisture, the plants will soon recover and grow away freely. Another advantage of planting in dry weather is that on slug infested ground, these pests are not so troublesome, and do not move about so freely as when the surface is moist, whilst materials used as deterrents to slugs, such as lime, soot, alum, etc., remain effective for a much longer period than when the soil is wet. Early Celery and Leeks intended for autumn use should be kept watered with well diluted liquid manure and encouraged to make rapid growth. The main crops of these vegetables should be planted so soon as the seedlings are ready. A sowing of Peas may yet be made for late supplies, choosing early maturing varieties, such as Pilot and Gradus, or any of the special sorts recommended by seedsmen for this particular purpose.

## HARDY FLOWER BORDER.

## PAEONIA VEITCHII.

This species (Fig. 205) belongs to the Anomala group of the Paeony family, and was found by Wilson in 1904 growing on the uplands around Tatién-lu, on the borders of Western China and Tibet. Here it was met with on the margins of thickets at an elevation of about 9,000 feet. At first sight it somewhat resembles the well-known *P. anomala*, but it differs in having branching stems bearing several flowers, while *P. anomala* usually bears only one on each stem. It is also later in flowering, taller growing, and with foliage having broader leaflets.

*P. Veitchii* makes a good, bushy plant, from two feet to three feet high, with purplish-crimson flowers about three inches in diameter, borne on drooping stalks which gives the plant a graceful appearance. Owing to the peculiar smell possessed by the plant it is known in China by a native name meaning "stinking Mountain."

Closely allied to the above is *P. Woodwardii*, from Kansu, where it was collected by Purdom in 1914. It is of the same graceful habit, but with dull green foliage instead of shining green, as in *P. Veitchii*. The flowers are also larger, from four inches to five inches across, and pale lilac in colour, tinged with rose.

Both species are excellent garden plants, and like a half-shady position, and a rich, loamy soil; they are ideal subjects for the wild garden or open woodland. *P. Veitchii* was described by Lynch in *The Gardeners' Chronicle* of July 3, 1909. W. J.

## LUPINUS.

VARIETIES of *Lupinus polyphyllus* are easily raised from seeds, which may still be sown in the open. The many beautiful named varieties, however, should be propagated from cuttings or division.

Herbaceous Lupins may be divided successfully during the spring when they are starting into growth, and they may also be divided after they have finished flowering, but in this case greater care is required to ensure success. If the weather is dry the plants should be kept watered until they grow freely at the roots and commence to make top growth.

The varieties with a sub-shrubby habit, of which Sunshine and Light of Loddon are good examples, are best increased by means of cuttings made from the lateral growths which develop as the plants pass out of flower. Where a large stock is required the cuttings are best inserted in beds of sandy soil in cold frames. When well rooted they may be lifted and transferred direct to their flowering quarters, or, if the sites are not vacant, they may be placed in pots and grown on until such time as they can be planted out. C.

## INULA GLANDULOSA.

*Inula glandulosa* is an acquisition to even the most select collection of hardy border plants. Like other Elecampanes, it has large, golden flowers of much beauty, and as its height is only about two feet, it is suitable for small borders, where taller subjects would be out of place.

The flowers are composed of fine disc florets and narrow, graceful ray florets which are so numerous as to produce a good effect, not being too wide apart to display their bright colouring to the best advantage.

This *Inula* has been in cultivation for many years and is quite hardy, not sharing the slight tenderness of its congener, *I. Oculus Christi*. The plant needs a rich soil and a sunny situation but not one that would be excessively dry in summer, as this would cause some of the lower leaves to wither. It may be raised from seeds or increased by division.

In later years a still superior form has been raised and sent out under the name of *Inula glandulosa superba*. It is considerably better than the type, giving large, finely coloured, yellow flowers of large size, with numerous, narrow, thread-like, ray florets. It is nearly a foot taller, but is in every way a most desirable plant. The variety may also be raised from seeds or propagated by division. Both are excellent flowers for a display in late summer and autumn. S.

## ALPINE GARDEN.

## SILENE HOOKERI.

WHEN I first saw this beautiful little plant at Chelsea a few seasons back, I was impressed by its loveliness and a longer acquaintance leaves me enamoured of its charm; the starry rosette produces large pink and white flowers over a long summer period, on stems but a few inches high.

The plant is very prone to injury by winter damp, and this evil should be obviated by the use of a square of glass. It is a good moraine plant and is both interesting and strikingly pretty when grown in a pan or pot in the alpine house; slugs have a great liking for this alpine treasure. R.

## FLOWER GARDEN.

## ERYNGIUM ALPINUM.

Of the Sea Hollies in cultivation, none rivals in beauty the European *E. alpinum*, a native of the limestone regions of the mid-alpine districts. It is said to be very limited in numbers there, and this seems strange to me, for I have grown it with ease, even in soils devoid of lime. In the garden it appears to love a sandy or light loam, and I recollect having some correspondence on the subject of this plant many years ago with the late Rev. C. Wolley-Dod. I told him that *E. alpinum* grew into large clumps which could be divided with a spade. Mr. Wolley-Dod, who had a heavy soil, was surprised at this, and asked me to send him a clump divided with a spade. This I had much pleasure in doing, much to the gratification of that splendid hardy plantsman.

*Eryngium alpinum* is a very fine species, well-coloured with blue up the stems and about the inflorescence, which consists of lovely, feathery-looking divisions, indescribably beautiful, on stems about eighteen inches high, rising above the foliage.

Years ago, when it first came to this locality, having been sent by a keen hardy plantsman from Dumbartonshire, it was called *E. planum* in error, but I had then few opportunities of verifying names of plants, and I experienced some difficulty in deciding its correct name. *E. alpinum superbum* is listed as a variety, but the plants vary considerably in the depth of the blue colouring.

I find that *E. alpinum* does best with me in a sandy soil but in cultivation it appears to have no partiality for lime. S. Arnot.

## EUPHORBIA EPITHYMOIDES.

Not many of the hardy Euphorbias are of sufficient horticultural merit to warrant their inclusion in a list of decorative plants; the above mentioned species is, however, an exceptionally fine garden subject, and should be more generally known and grown. It is not surpassed by any other member of the genus for planting in beds or borders, for naturalising in the wild garden or for cultivating in the rock garden.

Its height varies from one foot to eighteen inches, and the plant is of bushy habit, producing numerous leafy stems which are terminated by heads of bright yellow bracts, while the upper leaves are suffused with the same colour, a feature which adds to the attractiveness of the plant. The heads of bracts are four inches or more in diameter.

*E. epithymoides* is a native of central and eastern Europe; it flourishes in a loamy soil, although it will succeed admirably in dryish, sandy ground. The flowers are first produced early in April, and they continue in good condition until the middle of June.

Cuttings taken during summer, inserted in sandy soil and placed in a close, warm house for a short while, will root readily, and quickly form good-sized plants.

Late frosts may cause the stems to fall almost flat, but they quickly recover as the frost disappears, and the beauty of the plant is in no way diminished in consequence thereof. T. H. Everett.

## SPIRAEA FILIPENDULA FLORE PLENO.

OUR native *Spiraea Filipendula* is not very common wild in this country, being generally confined to chalky or limestone pastures. The species is a beautiful plant and worthy of a place in the garden, but even more beautiful and decorative is the double form, and this is especially suitable for growing in the front of the herbaceous border or for using as an edging to a border, as the finely divided, Fern-like foliage retains its pleasing green colour for the greater part of the year. The plant attains to a height of from one foot to fifteen inches, and each flower-stem bears a panicle of palest cream-coloured flowers, each tiny in itself, but in the aggregate forming a most lovely inflorescence. Prior to opening, the buds are of a pinkish hue.

June is its month of flowering, and should the weather be very hot and the ground dry, the blossoms are inclined to fade rather quickly; some little attention should therefore be paid to choosing a suitable situation at the time of planting. A semi-shaded situation and a moist soil are to be preferred, whilst the addition of mortar rubble or lime to soils at all deficient in this material is recommended. The ground should be well-dug and manured liberally. Established clumps should be lifted and divided every three or four years, September or October being the best time for transplanting. Dividing and planting may also be done successfully in April, but the current season's flower will be sacrificed, although every small rooted piece will grow when planted at that time of the year.

## IRIS GARDEN.

## IRISES AT KEW.

FOR a considerable time the Iris Garden has been one of the most attractive features of the Royal Gardens, Kew, and even now, when the earlier varieties have finished their generous display, there are plenty of later sorts to make the garden well worthy of a protracted visit.

Although Kew still retains the old specific nomenclature in many cases, the pure garden lover, who is not so concerned as to whether the Iris being admired is a pallida, plicata, squalens, neglecta, amoena or one of the other types, feels relieved to note that with the newer Irises their labels bear only the varietal name. For who could say, with certainty, in which section these lovely newcomers should be placed? It is much simpler to follow the new Iris Society and term these June-flowering Irises "Bearded Irises."

At the moment, it is the varieties of definitely bicolor type—those with buff or yellow shades or bronzy-pink standards, that make the first appeal to the garden lover as distinct from the botanist, and when, as is usually the case at Kew, they are grouped in quantity, they are especially effective. Of this type the best sorts at the moment are *Jacquimiana*, which has rose-tinted standards and freely-lined velvety purple falls. Dr. Bernice is of relatively dwarf habit, but bears quite large flowers with rosy-buff standards and purple falls. *Proserpine* has rosy-bronze standards and blue-purple falls. *Porsenna*, raised by Mr. Yeld, is a vigorous variety, bearing pale orange-buff standards and crimson-purple falls which are distinctly paler at the edges. *Astarte* is of very uncommon colouring. The standards are the same pale mauve as often seen in *Cattleyas* and the falls are bright rosy-purple.

While most of the Irises of more or less blue and blue-purple colouring have finished their flowering, there are still several varieties to carry on the season. *Black Prince*, which has smoky-toned falls lightened by a gold crest, is happily named. Mrs. Tinley, one of the best of what may be termed the greatly improved German Irises, still has a few beautiful flowers. *Parc de Neuilly*, another desirable variety, is a little later. E. H. Jenkins, of vigorous habit, has bluish-blue standards and purple falls. *Dalila*, which was shown so well by several exhibitors at the Iris Show is, at Kew, also a splendid garden variety. Its very pale flesh standards are in strong contrast to the rich

red-purple falls. Isoline, also prominent at the Iris Show, is very good at Kew, and this is one of the beautiful "Pink Irises." Tom Tit is the dwarfiest of the Irises now in flower, and it has plenty of rich blue flowers.

In addition to the garden varieties, there are several large-flowered species at Kew which are worthy of extended cultivation. *Iris sambucina* is a robust species bearing bronzy-pink flushed standards and rose-purple falls with yellow lines to the centre. *I. cypriana*, is the tallest large-flowered Iris now in flower, and it bears big blooms with pale mauve standards and deeper coloured falls, but it appears to require staking, which is a drawback in a garden Iris.

The large bed of *Iris sibirica* and its varieties is very interesting. Snow Queen is the best of the white varieties, while Perry's Blue, and the deeper blue Emperor, are both admirable. The very dwarf *acuta* is of stiff, erect habit, but has very pretty flowers. In the Iris Garden the season will continue for some time with the taller species, such as *I. Guldenstaedtii*, *I. spuria* and its varieties, *I. aurea*, *I. Monnieri* and *I. ochroleuca*.

The Water Irises are not so well represented at Kew, though there is a clump of the very uncommon *Iris fulva* (syn. *I. cuprea*), a graceful North American species which bears coppery-red flowers. *Iris laevigata*, over which those who have visited Japan rightly enthuse, is charmingly beautiful, while in the Rock Garden there is also *Iris hyerensis*, a garden variety which suggests *I. sibirica* as one parent, about two feet in height and bearing graceful purple flowers. A. C. B.

#### IRIS GAGUS.

This variety (Fig. 206) is one of the most attractive of the earlier bearded Irises. Although rarely more than two feet in height, *Iris Gagus* bears quite large flowers of great beauty. To those unacquainted with the fascinating combination of yellow and bronze in the best of the newer *Iris squalens* varieties, the first sight of such an Iris as *Gagus* comes somewhat as a revelation. The effect of the canary-yellow standards and rich purple falls with bronzy-brown veining is most entrancing. This variety received the R.H.S. Award of Merit in 1916 (after trial at Wisley), and in addition to its great charms it has the additional merit of being of easy cultivation.

#### IRIS MARGOT HOLMES.

The Iris Society has increased the award made to *Iris Margot Holmes*, raised from *Iris chrysographes* × *I. Douglasiana* by Mr. Amos Perry, and exhibited by him in Class 13 for a new seedling other than a bearded Flag Iris at the Society's Show on June 2, from a Silver Medal to a Silver-Gilt Medal. This Iris was also nominated as the best seedling Iris in the show for the Dykes Memorial Medal.

### GARDEN NOTES FROM SOUTH-WEST SCOTLAND.

AMONG several trees and shrubs which are flowering sparsely this year in reaction from their profuse blooming in 1926, none is more remarkable than the Laburnum—both *L. vulgare* and *L. alpinum*. Many of our trees have hardly any flowers on them. Upon one specimen of the hybrid *L. Watereri*, twenty feet high, which is usually richly draped with long, hanging racemes, there are but three trusses of flowers. *Piptanthus nepalensis*, nearly related to Laburnum, but, as Mr. Bean has noted, with flower sprays more like those of the herbaceous *Thermopsis*, has never proved satisfactory in the open here. It has survived a score of winters, indeed, and flowers sparingly each year, but evidently would be happier against a wall. Mr. E. H. Wilson introduced the Chinese *P. tomentosus* (? concolor) which takes much more kindly to our climate, and closely resembles the other species, except that its leaves and young growths are clothed with

a silvery down, giving a very distinct character to the plants.

When Mr. Wilson was here, two or three years ago, I showed him a specimen of *Prunus brachyloba* raised from seed he collected in China, and told him that I had decided to cut it out in order to relieve a good plant of *Eucryphia pinnatifolia* on one side, and *Rhododendron George Hardy* on the other. But that tree still stands, for Mr. Wilson protested against its removal, saying that it was far the best specimen he had seen in this country. It is now forty feet high, and hitherto has flowered but sparsely, but this year it is well set with sprays of blossom, very like those of our native Bird Cherry—*Prunus Padus*. In habit, however, it is far more erect and arboreal.

All the Daisy bushes are, or will be, exceptionally showy this year, the earliest to flower

tangle of *Corokia cotoneaster* (*Bot. Mag.*, tab. 8,425), but *C. virgata* (*Bot. Mag.*, tab. 8,466) is seldom seen, though it is far superior to the other in grace of growth. Early in June a bush eight feet high in a mist of yellow stars, was a very distinct and pleasing object. Cheeseman described three species of *Corokia* in his *Flora of New Zealand*, all with red berries; but he mentioned having collected "what may prove to be a fourth species, a twiggy bush, eight to twelve feet high, with slender branches, not tortuous. Flowers and fruit not seen." This was probably *C. virgata*, which has proved quite hardy here, the fruit being a bright yellow drupe.

Sharp and salutary has been the lesson we have learnt in the past spring about the advantage of late starting *Rhododendrons* over those which start early in growth. Two of the

FIG. 206.—IRIS GAGUS.

being *Olearia nitida*, now past, followed by *O. Gunniana* (stellulata), and *O. semi-dentata* with lilac flowers, the prettiest of the lot.

Of the shrubby Meadowsweets, the van was led in April by the snow-white *Spiraea arguta*, a triple hybrid which never flinches even under the cruel spring frosts it had to encounter this year. Next in succession comes the Japanese *S. bracteata*, which I prefer to the hybrid *S. Van Houttei* of similar habit and flowering simultaneously. Nearly related to the Meadowsweets is the Pearl Bush—*Exochorda grandiflora*—whereof I noted the merit in a recent issue, and will now only add that should anyone wish a charming group in May, let him place this shrub alongside of *Rhododendron Pink Pearl*. The shower of white sprays set off the rich rose of the *Rhododendron* with exquisite effect.

Most gardeners are familiar with the tortuous

latter class—*R. triflorum* and *R. villosum*—are now in full flower and form a fine contrast when planted near each other. Mr. Millais does them scant justice in describing the flowers of the first as greenish-yellow, and those of the second as "more striking than beautiful." The corolla of *R. triflorum* seems to me of palest sulphur, spotted with raw sienna on the upper lobe; and if the red-purple blossoms of the better forms of *R. villosum* are a trifle lurid, get the sun to shine through an eight-foot bush at its best, and one must be very fastidious not to enjoy the effect.

Among lowlier growths, there is no finer contrast at present than between the intense blue of *Cynoglossum nervosum* (*Bot. Mag.*, t. 7,513) and the vehement orange-scarlet of *Hippeastrum* (*Habranthus*) *pratense*.

The wild Hyacinth (which we in Scotland decline to speak of as the Bluebell) is prone to

invade the flower garden from neighbouring woods in greater number than is desirable, but the result of its flirtation with the Spanish Squill—*Scilla hispanica*—appears in the form of a very handsome hybrid, its flowers of a deeper blue than the Spaniard's, and the stem more robust than the native's. I counted forty-three blossoms on a two-foot stem this evening. *Herbert Maxwell, Monreith.*

## TREES AND SHRUBS.

### CONIFERS AT STOKE PARK.

THE spacious grounds of Stoke Park contain many large, old trees, but in the park itself these consist largely of Oaks, Limes and Elms. A piece of ground at the east end of the house must have been laid out in the form of lawns and planted with choice or very uncommon Conifers and shrubs many years ago. The trees have now attained great size; and the Deodar Cedars must have been planted about the time of their introduction. One of the most perfect and pyramidal now stands somewhere about ninety feet high, and has a straight trunk up to the drooping leader. This must be a fair rival to the fine tree at Westonbirt. A massive tree of the Algerian Fir (*Abies numidica*) stands about sixty feet high, and is well furnished with branches to the ground. Near by is a fine tree of the Monterey Pine (*Pinus radiata*), nearly as tall and in vigorous, healthy condition, such as is seldom seen so far inland. Even at Bournemouth bad trees of it may be seen. The Monterey Cypress (*Cupressus macrocarpa*) though more of a bush than a tree, is a very massive one, producing cones of great size. *Libocedrus decurrens* is a shapely tree of its kind, being perfectly columnar. It stands on the outside of the group and is conspicuous over the whole of the east side of the park. A specimen of *Cephalotaxus*, which I took to be *C. Fortunei* without close inspection, is eighteen feet high, and is tall for its kind. At the west end of the house are some trees of *Thuja orientalis elegantissima*, about eight feet high, though this is usually considered a dwarf variety. There are several of them and, being of some age, they look quite massive. Miss Jackson takes great interest in these trees, and I had the pleasure of being conducted over the grounds by her. *J. F.*

### VERONICA HULKEANA.

THOUGH not perfectly hardy in the open, this beautiful shrub does quite well if planted against a wall with a warm aspect. It is a semi-erect, loosely-branched shrub, from two feet to three feet in height, though in favoured situations it will grow much higher, its branches being terminated by large, branching panicles, of numerous soft lilac flowers.

The leaves are borne in pairs some distance apart. The are dark, glossy green, rather fleshy, one inch to two inches long, ovate in shape, with deeply-toothed margins, the base being either rounded or tapering into a stalk about half-an-inch in length.

The small, sessile flowers are about a quarter-of-an-inch in diameter; the panicles in which they are produced are often more than twelve inches long.

This *Veronica* is a native of the south Island of New Zealand and flowered for the first time in this country in 1864. *A. G. F.*

### CLIANTHUS PUNICEUS MAGNIFICUS.

THIS beautiful New Zealand shrub commenced flowering on April 25, on an open, west wall. The brilliant green, pinnate leaves form a fine setting for the flowers, which are of striking appearance; the latter are bright scarlet, shaped like a parrot's beak, and borne in large clusters. Of erect habit and a rapid grower, this shrub is well suited to training and will ultimately grow from fifteen to twenty feet in height.

During the growing season, fortnightly waterings with liquid manure improve the colour of the foliage and flowers, but feeding should be discontinued after July.

Although the variety is more hardy than the type, it requires the shelter of a west or south wall and protection in winter. It is easily propagated from seeds or cuttings; young plants should be grown in pots and planted in their permanent quarters when two years old. Considering that this shrub has been introduced over seventy years it is not so well-known as it deserves to be. *S. Bowler, Ford Manor Gardens, Lingfield.*

## MESEMBRYANTHEMUM.

(Continued from p. 253.)

### 5.—GIBBAEUM, HAW.

THE following matter relating to this genus is additional to that already published in *The Gardeners' Chronicle*, and brings our knowledge of it up to date.

**G. album var. roseum, N. E. Br.**—Besides the typical form with pure white flowers described in *The Gardeners' Chronicle*, 1926, vol. LXXIX, p. 215, Fig. 105, c. and g., Dr. Muir has discovered a more robust form which has flowers varying "from pale to very deep pink," to which the above varietal name may be given. But some plants of the same robust form have pure white flowers.

Riversdale Division: In the Klein Karoo, Muir, 3975!

**G. angulipes, N. E. Br.**—Stems procumbent or decumbent, with very numerous growths or short branchlets crowded into a compact mass of a silvery or greyish colour. Each growth in nature formed of two unequal leaves united for about 3 lines at the base, with the free part of the larger leaf  $\frac{1}{2}$ –1 inch long, and of the smaller leaf 4–10 lines long, 4–5 lines broad and 2–3 $\frac{1}{2}$  lines thick near the base, slightly flattened-subterete or trigonous-subterete, the larger leaf being less convex on the face than the smaller one, and its edges rather more distinct, sometimes slightly keeled on the back at the apical part, apex obtuse or bluntly pointed; surface smooth, velvety to the touch from being covered with a very minute, hoary, adpressed pubescence, the hairs pointing downwards; when at rest naturally the leaves are pressed together, but when growing (at least, under cultivation with me) they diverge from the base and more or less recurve. Flower solitary, terminal, with a new growth on each side of its base. Pedicel 6–10 lines long,  $\frac{1}{2}$ –line thick at the upper part, slightly narrowing towards the base, angular and together with the calyx velvety-puberulous like the leaves. Calyx subequally 6-lobed; lobes 2 $\frac{1}{2}$ –3 lines long and 1 $\frac{1}{2}$ –1 $\frac{1}{2}$  line broad, ovate, subacute or obtuse, keeled on the back, two of them with membranous margins. Corolla apparently about 8–9 lines in diameter; petals numerous, free, in about 2 series, 3–3 $\frac{1}{2}$  lines long,  $\frac{1}{2}$ – $\frac{3}{4}$ -line broad, cuneately linear, obtuse, apparently magenta ("red" according to Dr. Muir). Stamens numerous, erect, about 1 $\frac{1}{2}$ -line long, white; filaments hairy at the base. Stigmas 6, connivent erect, about  $\frac{1}{2}$ -line long, subulate acute. Fruit not seen.

*Mesembryanthemum angulipes*, L. Bolus in *Annals of the Bolus Herb.*, vol. IV, p. 2 (1925).

Riversdale Division: In the Klein Karoo, at 1,000–1,300 feet above sea-level, flowering in September and October. Muir, 3898!

This interesting species at first sight is quite unlike the other known members of the genus *Gibbaeum* on account of the leaves being free for a great part of their length, and divergent when growing, but its flowers and pubescence demonstrate that it belongs to this genus. It was discovered by Dr. J. Muir in 1923 and sent to Mrs. Bolus, who described it as above-quoted, but without indicating its true affinity. Dr. Muir informs me that in South Africa "It is a silvery, often depressed, somewhat scrubby undershrub, often with decumbent or spreading branches, and grows on flats and hillsides from 1,000–1,300 feet. It occurs partly on the quartz fields and partly on the adjoining Bokkeveld shales in the Klein Karoo, flowering copiously in September and October."

From Dr. Muir's account it would appear that it attains to the height of an undershrub in South Africa; with me, however, the plant of it I received from Dr. Muir is prostrate, and only attains a height of about 2 inches above the ground. In this country also, as the growth takes place in the colder and more sunless part of the year, two or even three pairs of leaves are present at the same time on the growths, as there is no sun heat to dry up the old leaves.

**G. dispar, N. E. Br.** in *The Gardeners' Chronicle*, 1926, vol. LXXIX, p. 215, Fig. 105b. —Pedicel 1–2 lines long. Calyx subequally 6-lobed, lobes about 2 $\frac{1}{2}$  lines long, two of them keeled and green, the other four flat, broadly oblong and with membranous margins, rounded at the apex. Corolla 12–13 lines in diameter, fully open from 10.30 in the morning, according to Dr. Muir; petals in one series, about 5–5 $\frac{1}{2}$  lines long and  $\frac{1}{2}$ – $\frac{3}{4}$ -line broad, linear, obtuse, intense pink, with the median line very faint or absent (ex Muir). Stamens numerous, 2–2 $\frac{1}{2}$  lines long, filaments not hairy at the base, white; anthers yellow. Stigmas 6, finally 2 $\frac{1}{2}$  lines long, erect, filiform-subulate. Ovary flattish at the top.

This completes our present knowledge of this plant, the above description being made from flowers of the type. Muir 3797; sent to me by Dr. Muir.

**G. geminum, N. E. Br.** in *The Gardeners' Chronicle*, 1922, vol. LXXI, p. 129, Fig. 64r, and vol. LXXIX, p. 215.—Dr. Muir informs me that this species "forms mats on carpets up to several feet in diameter, and is found most commonly on the flats in clayey soil, also often in brackish places. Less commonly in gravelly places on the shales away from the quartz fields."

**G. Shandii, N. E. Br.**, in *The Gardeners' Chronicle*, 1922, vol. LXXI, p. 129, Fig. 64, d. e., and vol. LXXIX, p. 235.—I am now able to add a description of the flowers of this species made from dried flowers sent to me by Dr. Muir:—Pedicel 7–8 lines long and together with the calyx minutely puberulous like the growths. Calyx subequally 6-lobed; lobes about 2 lines long, two of them keeled, the others flatter, oblong, obtuse, with narrow, membranous margins. Corolla 9–11 lines in diameter; petals in one series, about 3 $\frac{1}{2}$ –4 lines long and  $\frac{1}{2}$ -line broad, linear, apparently acute, "deep pink, with a darker median line from base to apex," ex Muir. Stamens numerous, collected into a cone  $\frac{1}{2}$ -line long; filaments not hairy at the base, "of the faintest flesh colour; anthers yellow." Stigmas 6, about  $\frac{1}{2}$ -line long, shortly subulate, acute, greenish, connivent in the flower seen, but perhaps spreading in older flowers. Top of the ovary flattish.

Ladismith and Swellendam Divisions: In the Klein Karoo, Muir, 3815!

Dr. Muir informs me that in nature this is a smaller species than *G. pubescens*, that it "does not glitter in the sun and occurs in quite different localities usually." "*G. pubescens* is a larger, finer shrub, glittering silvery and always on the quartz fields. *G. Shandii* is much smaller, drab and somewhat dirty-looking, and prefers the stony broken Bokkeveld shale areas, which are mostly dark brown. *G. pubescens* has as a background the white quartz fields which make the eyes ache. *G. Shandii* a dark ugly, stony background. You can distinguish them in a fast travelling motor without getting down." Since these two plants are so easily seen, as they form "little, mound-like clumps dotted over the country," their colour resemblance to their surroundings cannot be in any way protective, therefore there must be some other explanation of it than the one of "protective resemblance," which is usually applied to such resemblances. Can it be that there is some unknown physical action brought to bear upon the plants by the reflection of light from their surroundings that causes them to be somewhat similarly coloured? The colouration of *G. Shandii* and *G. pubescens* in my greenhouse is hardly distinguishable and much greener than in nature. *N. E. Brown.*

## INDOOR PLANTS.

## CISSUS DISCOLOR.

THIS easily-grown exotic of scant habit may well be included in all collections of warm-house subjects; the somewhat insignificant flowers are greenish-yellow and are usually produced in late summer.

The leaves are cordate-oblong, acuminate, with bristly serratures at the edges; the upper surface is bright green, spotted and mottled white, the underside reddish-purple; both surfaces are smooth. The thin veins are pink and there is a slight pink suffusion at the extremities of the white patches, the effect being very pleasing.

This favourite of other days was introduced from Java in 1854, and is illustrated in *Bot. Mag.*, t. 4,763; it also forms the subject of an excellent plate in Lowe's *Beautiful-Leaved Plants*.

*Cissus discolor* succeeds in sandy peat and loam, and is easily propagated from cuttings; it is a fine pillar or rafter plant, and in former days, balloon-trained specimens were frequently seen at exhibitions.

## EOMECON CHIONANTHA.

THIS plant has flowers of purest white, with golden stamens, surmounting the decorative foliage, and it is an admirable subject for planting in a cold house; in favoured localities it might well be given a trial in the open air.

The flowers are terminal, on slender pedicels; the scape grows about one foot high, is red-tinted, and branched. The leaves are radical, and heart-shaped, with the margins prettily sinuated.

The plant spreads rapidly in fairly light and good soils, and a mass, in April, is a very pretty sight. Increase is easy by division.

A monotypic genus of Papaveracea, *E. chionantha* was introduced from China in 1885, and is figured in *Bot. Mag.*, tab. 6,871. *Ralph E. Arnold.*

## ORCHID NOTES AND GLEANINGS.

## ORCHIS FOLIOSA × O. MACULATA.

THIS hybrid is a very beautiful plant, as is testified by the fine clump in the Kew rockery.

In general habit the plant resembles the Madeiran species, although it is somewhat stronger in growth. The leaves are distinctive in that, although they are quite as large as those of *O. foliosa* (Fig. 207), large chocolate blotches are spread over the leaf surface, especially around the leaf margin, and are no doubt derived from *O. maculata*. The inflorescence is unusually large and of a bright rosy-purple, rather deeper than in *O. foliosa*. In addition to the depth of colour the flower is freely marked with the deep purple lines found in *O. maculata*. This hybrid thrives in a moist but sunny position. Although *O. foliosa* is a handsome Orchid, the hybrid is superior. *T. D. Boyd.*

## EVERGREEN DENDROBIUMS.

THE genus *Dendrobium* unquestionably occupies the first place among the epiphytal Orchids of the Old World in the estimation of horticulturists, and the recent exhibition of some of these beautiful plants brought back memories of the many superb specimens of past days, when there were no more popular plants for exhibition. *Dendrobium chrysotoxum*, *D. densiflorum*, *D. thyrsiflorum*, *D. suavisimum*, *D. Brymerianum*, *D. clavatum*, *D. Farmeri*, *D. aggregatum*, *D. Dalhousieanum*, its variety *luteum*, *D. fimbriatum* and *D. f. oculatum*, comprise the best known garden species and varieties and those most generally grown. The hybrid *D. illustre* which was raised by Messrs. James Veitch and Sons in 1895, from *D. chrysotoxum* crossed with *D. Dalhousieanum*, is one of the parents of the lovely *D. Gattton Sunray*, shown by Sir Jeremiah Colman in 1919.

*D. Gattton Sunray* is derived from *D. Dalhous-*

*ieanum luteum* crossed with *D. illustre*, and is a proof of the progress made in Orchid hybridisation during the last decade.

The hybrids in this section are few, and more interesting to the hybridist than from a horticulturist standpoint, as few are so effective as garden plants as the species.

The greater number of those named produce their flowers at this season, and are splendid subjects for a variety of purposes on account of their brilliant colouring.

These *Dendrobiums* need a longer season of rest than many other Orchids; they are also late in starting into growth, but when started growth is rapid. Soon after the flowers fade, new growths will appear from the bases of the

growers, such as *D. aggregatum*, are best grown in pans. The old, decomposed material should be removed, also any dead roots and useless back pseudo-bulbs. As a rule, the roots are not long-lived, and no harm need be feared by disturbing them. For most of these *Dendrobiums* slightly larger pots or pans may be used than for the members of the deciduous section, but overpotting must be guarded against. The receptacles should be well-drained and the plants potted firmly. After repotting, thoroughly cleanse the foliage, and place the plants in a position well exposed to the light. The dwarf-growing species are best grown suspended from the roof rafters, while the taller growing kinds are best accommodated

FIG. 207.—ORCHIS FOLIOSA.

last made pseudo-bulbs, and any necessary repotting should be done then.

The roots of the strong-growing, evergreen kinds are usually larger and more robust than those of the deciduous species; therefore, the compost for them may be used in a coarser condition. Two parts of *Osmunda* or A.1. fibre to one part *Sphagnum*-moss, mixed with sufficient broken crocks to render the compost porous, forms a suitable rooting-medium. In the preparation of the compost it is essential that the ingredients should be thoroughly cleansed, removing all the earthy particles; discard any pieces of the fibre which show a tendency to produce fungous growths. Plants that need repotting should be carefully turned out of their receptacles; pots are the best receptacles for the strong growers; the small

on the stages, where they may receive the maximum amount of light. For a time, very little water at the roots will suffice, only sufficient to keep the rooting material just moist; but plenty of atmospheric moisture and frequent sprayings overhead and on the undersides of the foliage when the weather is bright and warm, will assist the plants in making clean, satisfactory growth. During the growing season, as the plants become well-rooted, liberal supplies of water will be needed by the roots until the new growths are completed, when only sufficient moisture should be given the plants to prevent shrivelling. These Orchids thrive best and keep most regularly to their seasons of growth and rest when grown in an even temperature, such as a warm *Cattleya* house provides. *J. T. B.*

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden W.C. 2.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on one side ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Special Notices to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

## MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA\*

### XII.—RHODODENDRONS.

BESIDES the Rhododendrons already mentioned, several of which were abundant, though others, such as the 'Haematodes' did not extend so far up the valley, I found two species in flower this day; a large, bushy 'Anthopogon,' with coral-red flowers, and a smaller 'Saluenense,' with vivid magenta flowers. This was R. rivulare, again a plant I discovered in Tibet in 1926—K.W. 5,828 = 6,903. Many of the species of 'Saluenense' are much alike, and from the gardener's point of view, can be ignored as mere repetitions; but the Seinghku valley yielded three dwarf species as distinct as any that can well be imagined, though the only one in bloom as yet was the one mentioned above. I was, however, not unmindful of the other two, which I spotted long before they opened their buds to my expectant gaze.

During the next ten days I explored every valley, cliff and glen, reaping a fine harvest of good things, and climbing gradually higher as the snow melted, though it was unnecessary to climb much above 13,000 feet, at all events till far on in the year. Though the snow line on the southern, or rather eastern, flank of the Irrawaddy-Brahmaputra divide stands at over 16,000 feet (and on the western flank higher still), it is evidently only within very recent time that it has retreated. The valley, then, has been heavily glaciated, and between 14,000 and 16,000 feet are mostly bare cliffs and barren screes, with a very sparse high alpine flora, as though few species had yet had time to colonise the new domain, or try and adapt themselves to such unusual conditions.

On the more sheltered flanks, Abies and the pink-and-cream 'Falconeri' Rhododendron formed the last of the straggling forest; but the exposed slopes were entirely devoted to dense thickets of Rhododendron, through which it was impossible to plough a way. However, nature here came to the rescue, and had scored the flanks of the mountains with many gullies, some of them broken by wall-like escarpments, but most of them climbable. By means of these steep and narrow corridors one could reach the dwarf Rhododendron carpet above (now sleeping beneath the snow) or the alpine turf slopes, or the screes. The main valley was so cold and bleak that, until June 18, I made no attempt to follow it up to the next junction, which stands at an altitude of 12,000 feet. Before that

I had been up to the head of the branch valley, which was also under deep snow.

The bulk of the Rhododendrons in flower at or above 11,000 feet belonged to the 'Thomsonii' series, and were of the Souliei type. But they showed great variation in flower colour, as well as in minor technical points, so much so that it was difficult to classify them until I began to tabulate their characteristics. Even so, it was quite impossible to say with certainty which were good species and which, if any, varieties or hybrids. According to modern ideas, no doubt they were all species; for it is the fashion at present to split

merely rare, but rare in a particular sense, occurring as a few plants found in one spot, all together, and so far as my observation went, nowhere else.

Such were the two charming pink 'Soulieis,' K.W. 6,921 and K.W. 7,089, and to a less remarkable degree, the feathered cream 'Soulie,' K.W. 6,922, and the yellow trumpet 'Soulie,' K.W. 6,930. But while there might be some argument as to which were good species, and which were the pick of the bunch, there could be no two opinions about Cherry Brandy (K.W. 6,923), which flowered all by itself in July, when the others had retired by rotation. Here the

FIG. 208.—TIBETAN HUTS IN THE SEINGHKU VALLEY.

judgment of Paris was safe from misrepresentation and (always excepting the solitary 'Rose Thomsonii,' K.W. 6,900), Cherry Brandy was unique, easily the most lovely, as it was the most unusual of the 'Thomsonii'; and it flowered alone in its glory, in July. But again I anticipate—June is still with us.

I add here an analysis of the 'Thomsonii' Rhododendrons collected.

No.	Calyx.	Corolla.	Filaments	Anthers.	Ovary.	Style.	Stigma	Pedice.

with some one new or more or less remarkable character of its own. But hybrids tend to merge the parental characters, and to lose the salient distinguishing characters of each; and the facts point quite as strongly to 'sports,' or as we should say nowadays, mutations, as to hybrids, except for one thing. Most of them set no seed, or so little as to be almost negligible; which is just what one would expect of a hybrid.

Some of the species (or varieties) such as the ordinary yellow Souliei (K.W. 6,868) or the speckled white (K.W. 6,869) were abundant, and formed great colonies. Others were not

Seed was collected of all these, and it will be interesting to see how many of them come true to description.

It will be noticed that four species have definite pit-glands, i.e., small, circular areas especially adapted for secreting honey. In the remainder, the base of the corolla is pinched up, or fluted, so as to form five pocket-glands, but here there is no differentiation of tissues. The former must therefore be regarded as the higher type, and the distinction between pit-glands and pocket glands may prove a useful taxonomic character.

The question of natural crosses is exceedingly

\* The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1926, and January 1, February 19, March 5, 19, April 9, 30, and June 4, 1927.

interesting, and there seems to me good evidence that *Rhododendron* crosses were common here. It must be remembered that I was exploring in a country where life is rampant, not only in the teeming jungle below, but in the upper temperate forest, and in the alpine region also. New species are being evolved by the

FIG. 209.—MECONOPSIS SP. GROWING IN THE UPPER SEINGH KU VALLEY AT 12,000 FEET ELEVATION. FLOWERS VIOLET.

necessity for adaptation, or continuous adjustment to changing conditions—for clearly the great glaciers have retreated from the Seinghku valley in comparatively recent times. But under conditions so unstable, a fixed adaptation is almost impossible, and what we see is frequently no more than a hasty compromise.

Where conditions have remained fixed for a long time, as in the desert or the jungle, for instance, adjustment has been achieved, and highly specialised insects pollenate highly specialised flowers. Everything else has been eliminated. But where only a rough and ready relationship has been attained—and in alpine regions abnormal weather is the rule—the result is a greedy scramble. Hosts of insects, large and small, visit the flowers, not only for food, but also for shelter; and birds visit them for insects. In the turmoil everything gets mixed up, and pollen is moved about recklessly.

The 'Thomsoni' *Rhododendrons*, which were particularly abundant, showed by far the widest variation, and they were regularly visited by a small, brilliantly coloured Honeysucker. These birds undoubtedly visited the flowers of various *Rhododendrons* in order to get at the insects which took shelter there when it was raining; the wetter it was the more flies one found inside the flowers, and the more the birds visited them. But that it was probably the Honeysuckers, and not the tiny sand flies which pollinated the flowers seems to follow from the fact that the prostrate *R. repens*, which is visited by ants, but not by birds, set little seed.

In June, whole slopes were hotly lit up by the scarlet bells of *R. repens*, which formed interlacing mats on the turf or rock slopes; but vivid and conspicuous as they were, it was impossible for birds to get at them easily, by reason of their position. Nevertheless, the ant is an active and methodical insect, far more intelligent, one would suppose, than a fatuous sand fly; and yet, when autumn came, I was hard put to it to find capsules of *R. repens*, and I doubt whether one ripened seed where ten flowers had flourished. I had noted the same seed shyness in Scarlet Runner,

in Tibet, which at harvest thanksgiving let me down in precisely the same way.

On the other hand, the bush, scarlet-flowered species ('Sanguineum' and 'Haematodes') and all the Thomsonii *Rhododendrons*, with the exception of the alleged hybrids, set seeds lavishly; and the inference is that the birds are safe pollinators, whereas the insects are more uncertain.

The arguments in favour of hybrid *Rhododendrons* in nature then amount to this:—

(i) The plants occurred singly, or in compact, confined clumps, in the midst of two or more other species, at least one of which had obvious features in common with the supposed hybrid. As a rule, both probable parents could be recognised by leaf and flower characters.

(ii) Each alleged hybrid was found once only, in that particular spot, and nowhere else. (That argument would apply equally well to a mutation; but taken with the other evidence, it supports the hybrid theory).

(iii) They either seeded badly or, in one instance, set no seed at all.

Three species of 'Thomsonii' *Rhododendrons* were abundant, forming presumably the basis of all the supposed hybrids, namely, K.W. 6,833, a forest tree with pinkish flowers; K.W. 6,868, a scrub species with sulphur flowers;

calyx, a scarlet flower, and no flecks on the leaves.

K.W. 6,921.—Flowers white, flushed pink, with five pluming, shining pit-glands at the base, and crimson, mackerel spotting on the upper half. One or two bushes on the edge of dense thickets of 'Thomsonii' and 'Sanguineum.' Possibly a hybrid of K.W. 6,869. Flowered moderately, but only two or three capsules ripened.

K.W. 6,922.—Flowers cream, with a large, well-designed Prince-of-Wales Feathers picked out in crimson dots and dashes on the upper lobe. Half-a-dozen bushes scattered down the brink of an open, stony gulley, just beyond the dense *Rhododendron* thicket. Flowered moderately, seeded very badly. Possibly a hybrid of K.W. 6,869.

6,930.—Flowers bright sulphur, with a purple flash at the base. An isolated clump of bushes on an open grass slope. Flowered brilliantly, but set only moderate seed. Possibly a hybrid of K.W. 6,868.

K.W. 6,936.—Flowers pink. A clump of bushes surrounded by the white-flowered 6,869 and the yellow-flowered 6,868. Flowered freely, set fairly abundant seed.

K.W. 6,945.—A solitary plant growing on the edge of the *Rhododendron* thicket. Flowers

FIG. 210.—VIEW IN THE UPPER SEINGH KU VALLEY IN THE MIDDLE OF JUNE.

K.W. 6,869, a bushy species, with white flowers, peppered purple. In addition to these, a fourth species, K.W. 6,923, with bicolor flowers was moderately abundant.

The following are believed to be hybrids:—

K.W. 6,900.—Possibly a 'Thomsonii' hybrid, but doubtful. The slight, hairy felt on the under leaf surface suggests 'Sanguineum' parentage. Only one bush found, on the outskirts of dense *Rhododendron* scrub. Flowered well, the flowers much larger than those of any other 'Thomsonii' *Rhododendron* met with, of a glowing rose-pink. Seeded moderately. A magnificent plant. It has been compared to *R. Meddianum*, which has a much larger

over, but apparently pink. The leaves recall those of the *Sanguineum* K.W. 6,831. Only two flower trusses, and about three good capsules.

K.W. 6,962.—Flowers purplish-pink in bud, changing to milk-white, with a ruddy purple flush and a dark flash at the base. Flowered splendidly, seeded moderately.

K.W. 6,965, 6,966.—Hybrids, or varieties, of 6,868, growing together on the edge of the forest. One of them set no seed, the other very little, but out of flower it was impossible to distinguish them from each other, or from 6,868.

K.W. 7,089.—Flowers a charming shade of flesh pink. A clump of about a dozen plants

found growing in the midst of the *Sanguineum* 6,831 and the *Thomsonii* 6,868. It set no fruit at all—the only species of which no seed was gathered.

K.W. 7,090.—Flowers carmine. Two plants growing amongst the small *Lactum*, 6,954, and 'Scarlet Letter' 6,955, with the leaf indumentum of a *Lactum*, and the flowers of a *Sanguineum*. It set a little seed.

K.W. 7,190. Not seen in flower. Two or three small bushes scattered in open thickets of *R. Roxianum* (7,184), *R. Souliei* (7,189), *R. heliolepis* (7,108), and *R. prunifolium* (7,188). It has the *Roxianum* type of fruit and the *Souliei* type of leaf, and set good seed.

From the above descriptions, it will be seen that most of the supposed hybrids are derived from *Thomsonii* forms, but that *R. sanguineum*, *R. lactum* and *R. Roxianum* are believed to enter into the composition of a few. F. Kingdon Ward.

trees and shrubs and a choice assortment of ornamental plants.

That flower gardens, lawns and shrubberies should be generally unknown is due to a variety of circumstances. I may, perhaps, put in the forefront the fact that it is unnecessary to cultivate flowers in an island which is a perfect Paradise during a great part of the year where it is possible for flowers to thrive. At their doors, in almost every part of the island, are to be seen at all times, except during the hot, dry summer months, such flowers as can only be found in England under the most careful cultivation. More common than any wild flower in the home-land is the tall *Asphodel*, which has become a weed and a pest. Splendid *Spurges* (*Euphorbias*) abound, bulbous and tuberous plants, such as the *Crocus*, *Anemone*, *Squill*, *Cyclamen* and *Star of Bethlehem* are ubiquitous, while the bush or maquis is aglow with various magnificent species of *Cistus*, *Heath*, *Lupin*, *Salvia*, *Laven-*

there is hardly space to swing the hoe or wield the long, straight-handled spade.\*

As in almost all sunny lands, primary thought is given to the vine, and in many parts every available spot is planted with this invaluable servant of man. Vin ordinaire takes the place of tea and coffee or beer and minerals; these latter having only been introduced of recent days to meet the depraved tastes of the foreigner. Delicious water may be found in most parts of the island, but this is apt to be polluted, and some reliable beverage is always a desideratum. Hence, horticulture is in great part viticulture. Many other fruits are to be found in cultivation. These include Oranges, Cherries, Almonds, Apricots and Peaches, Olives, Figs and more rarely the Loquat or Japanese Medlar, the Carob and the Walnut. The Chestnut grows in vast plantations and is an invaluable tree on account of its nutritious fruit, and Walnuts are also grown; but these hardly come under the head of horticulture.

All the well-known salads and vegetables are grown in Corsica. In April one is served at lunch or dinner, even in the most inaccessible places, with Radishes and Lettuce, either as *hors d'oeuvres* with Olives and sardines, or as a salad. Spinach is frequently served as a separate course, especially in country inns, where a contract has been entered into to supply the foreign visitors with a given number of courses for each meal. The meagre supplies are eked out by separating the vegetables from the meat or the salad from the chicken. Beans and Peas, Gourds and Gherkins, Globe Artichokes and other well-known vegetables, find a place in most gardens of any pretensions. I have only once had the Globe Artichoke served up, however, in an appetising way, and usually find it a most unsatisfactory vegetable.

It is in April and May that the gardens are at their best. Most things, except in very high and exposed localities, are then as far advanced as they are with us in June and July, the season when garden produce is at its maximum.

There are great possibilities in Corsica for the landscape gardener, and particularly for any one who is skilled in rock gardening. A few of the more wealthy inhabitants have already set an example which is worthy of imitation. At Pino, for instance, connected with the chateau of the family of Piccioni, are some very beautiful grounds, and one finds in the Guide Book the remark—"A cit, sur un rocher, est un couvent dont les jardins descendent en terrasses." That is just the way in which gardens must usually be laid out in a country like this. It was here that Dr. Bennet, who did so much to bring Corsica to the notice of English invalids, met M. Piccioni, who introduced him to the village priest. His words are of special interest in this connection. "We found the priest a tall, intelligent, fresh-looking, gentlemanly man of about forty, with a kind, good natured, simple expression of countenance. He was in the garden of a little square stone house that had been recently erected for him in a most picturesque situation. He showed us his vegetables and his flowers . . . then we had to drink wine he had made from his own vintage, and to eat bread made from corn grown on the mountain side." (*Op. cit.*, p. 367).

I shall not soon forget my visit to this charming locality. Close to the mortuary chapel of M. Piccioni, with its family tomb of lovely serpentine from Erza, I found the only snake (*Coluber elaphis* probably) which I saw in Corsica, and from the banks and hedgerows culled quantities of the choicest of wild flowers and Ferns. Here I saw, what I had once seen stated elsewhere, the cultivated *Pelargonium* thrown out on a rubbish heap, flourishing as if it were in a greenhouse. I look forward to the day when many of the romantic heights will be crowned with a lovely mansion of local granite and the grounds picturesquely laid out in

\* I have found, since writing the foregoing, a similar statement respecting Mentone in the middle of the nineteenth century in a volume which did much to arouse interest in the Mediterranean Islands and sea-board. See *Winter and Spring on the Shores of the Mediterranean*: J. A. Bennet, M.D., London, 6th Ed., 1875, p. 194, seq. See also Part II. for a valuable chapter on Corsica, with occasional references to garden-craft on the Island at that period.

FIG. 211.—NUNG GIRL PORTERS IN THE UPPER IRRAWADDY HEADQUARTERS.

## CORSICAN HORTICULTURE.

THE lover of the garden cannot fail to be disappointed if he goes to Corsica hoping to see horticulture in a high state of development; and particularly if he expects to see in town and village beautiful flowers under cultivation, well-kept lawns and lovely shrubs. What it is possible to do may be seen, indeed, in the gardens attached to the hotels and villas, or in the grounds connected with Napoleon's Grotto at Ajaccio; but these do not represent Corsican horticulture as we should generally understand it.

While these remarks apply to Corsica as a whole, it should not be overlooked that a number of the wealthier inhabitants have begun in recent years to imitate their fellow countrymen of the South of France. More frequent intercourse between the Island and the Riviera, and the presence of a considerable number of English and American residents, have greatly stimulated the love of the garden during the present century.

Thanks to the enterprise of certain wealthy residents, and the influence of English and other settlers, there has been considerable progress in horticulture during the present century. Thus at Barbicaja one finds at an altitude of upwards of 300m. a chalet with a very fine garden which produces Bananas and Guavas as well as choice Mandarin and Blood Oranges. It is the purpose of the owner to establish here a school of floriculture. Flowers may also be purchased at Carrosaccia, between Ajaccio and Alata. In connection with the Chateau de la Punta there is a large piece of ground known as Le Jardin Anglais which has been admirably laid out and stocked with rare

der, blue Pimpernel, all kinds of Broom and prickly *Cytisus*, Rosemary, Everlasting Compositae of numberless species, with Buttercups, Irises, Orchis and a thousand other lovely flowers in the moister places. The shrubs also include the *Laurustinus*, Myrtle, *Phillyreas*, Roses, twining Honeysuckles, *Clematis*, *Smilax* and a host of other plants whose fragrance and aroma are proverbial.

The native has not yet, however, developed that taste for flowers which is so marked a characteristic with ourselves. Moreover the small available plots of ground are in most instances insufficient for the growth of the necessary vegetables, food plants and fruits, and it is, therefore, practically impossible for the bulk of the people to find space for such a luxury as a flower garden. There is, further, an almost entire lack of the rich humus which is so great an asset in our island. Corsica is a land of mountains; and a land of mountains without any corresponding valleys. It is as though the Vale of Lorton and the fertile lands around Bassenthwaite, Keswick and Grasmere were taken out and Honister piled on Helvellyn, Cader and Snowdon on the Grampians, leaving only steep gullies and inaccessible crags between. Only by desperate and age-long exertions have small clearings been made here and there, and the soil in these is usually so stiff and heavy that great industry is required to make it fit for planting. This is true of three-fourths of the island at least; and it is only a few places, such as the district on the east of Ajaccio, and the malaria-stricken east coast, for example, that there is room for the plough, and soil which can be used for cereals. Among the mountains the plots set apart for vegetables and horticulture are frequently only two or three yards in extent, and have in many instances to be reclaimed from crag and rocky height where

terraces with serpentine paths and motor roads. For health and beauty no situations that I have ever seen could surpass those which cry for the lover of the landscape garden in Corsica. And now that there is a regular airway between the island and the Riviera the distance from the more popular haunts of men is immaterial. *Hilderic Friend, Cathay, Solihull.*

## THE GLADIOLUS.\*

(Concluded from page 416.)

GLADIOLUS *primulinus* (species) was first shown at the Carnation and Fern Conference and Exhibition, in London, July 22, 1890, among a group of plants sent from the Royal Gardens, Kew. (See *Journal R.H.S.*, XII, page CIV). It was described by the late Mr. J. G. Baker in *The Gardeners' Chronicle*, August 2, 1890. On August 22, 1904, it was again exhibited before the Royal Horticultural Society by Francis Fox, Esq. (later Sir Francis Fox, who died recently), of Wimbledon, who called it "Maid of the Mist," and it received a Botanical Certificate—votes unanimous. Mr. Fox stated that the plants grew in the Rain Forest, immediately in front of the Victoria Falls of the river Zambesi, exposed to perpetual spray.

On September 1, 1908, Messrs. R. Wallace and Co., Colchester, exhibited a strain resulting from the crossing of *G. primulinus* with *gandavensis*, and received an Award of Merit for the strain; votes unanimous. Messrs. R. Wallace and Co. state that their corms were obtained from the late Dr. Van Fleet, of U.S.A.

On August 16, 1910, Messrs. Kelway and Son exhibited *Gladiolus primulinus* (species), which was given an award of Merit by the Royal Horticultural Society. Mr. Francis Fox had sent some corms of the species to Messrs. Kelway and Son in the year 1905. He informed them that Mr. Townsend, who was in charge of the building of the Zambesi bridge in 1903, had collected these bulbs and had sent them to him. The writer handed them at once to Mr. F. Field, *Gladiolus* foreman, with instructions to grow them inside and outside, and to cross them as soon as possible with the best varieties of the large-flowered section, which the firm had so long cultivated, and which were descendants from *Gandavensis* and *Nanceianus*. The corms sent by Mr. Fox flowered in 1906, and were hybridised and used for hybridising. By 1910 to 1912 we had raised a stock of several hybrid varieties which were selected from numerous seedlings and named, and in 1912 the Royal Horticultural Society gave an Award of Merit and their Silver Flora Medal for our exhibit of the strain, and the National *Gladiolus* Society at the same show gave an Award of Merit for

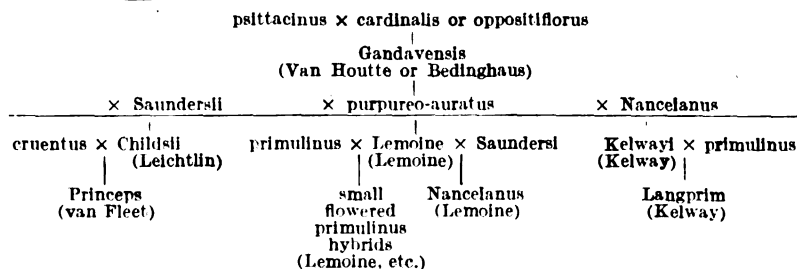

is quite a new strain of hybrid *Gladioli*, the majority of which are the result of crossing *Gandavensis* hybrids with *G. primulinus*. They are most graceful in habit, and exhibit a wonderful range of charming colours, including pure yellow, pale lemon yellow, apricot flushed with rose, reddish orange, orange and pink. They bear from twelve to fifteen flowers on a spike. The individual flowers resemble those of *G. primulinus* in shape. The strain includes the following named varieties:—'Banshee,' 'Elf,' 'Ella Kelway,' 'Ghost,' 'Josephine Kelway,' 'Queen of the Fairies,' 'Sylph,' and 'Wraith.'

The first large-flowered hybrid varieties of this section which, so far as I know, were ever catalogued by anyone, were Golden Girl, Ella Kelway, Josephine Kelway, Wraith, Friendship, Banshee, and Elf, and all of these were offered to the public in 1913. We called the section Langprim, being desirous of connecting *G. primulinus* with Langport, the chief English home of *Gladioli* for half-a-century.

Mr. A. J. Bliss wrote to *The Gardeners' Chronicle* of October 2nd, 1926, stating that in 1905 Sir Leicester Beaufort, then Chief Justice of Northern Rhodesia, gave him 50 corms of *G. primulinus* which he had obtained from Mr. Francis Fox. Mr. Bliss gave some of these to Kew and some to Mr. W. C. Bull, of Ramsgate. Messrs. V. Lemoine and Son, of Nancy, France, crossed *G. primulinus* with yellow varieties of the Lemoinei section, and catalogued in 1908 the first hybrid, which he called *G. primulinus* major, and followed it up in 1909 and 1910 with *G. primulinus salmoneus* and *G. primulinus maculatus*. These are comparatively small in flower and very hooded, as would be likely, seeing their parentage on both sides, and belong to another section than the Langprims. Mr. A. Amos (senior) had hybrid seedlings of *G. primulinus* about the year 1910. The pure white variety was raised by Mr. A. E. Amos and exhibited in 1926.

In 1913, Messrs. Vilmorin Andrieux and Co., of Paris, exhibited at the Ghent International Exhibition a hybrid strain of *G. primulinus*, and again at the *Gladiolus* Society's Show at the Drill Hall in London in 1914, but, as was stated in *The Gardeners' Chronicle* in 1914, by Monsieur S. Mottet, "it had not been thought worth while to have named varieties."

This is as complete an account of the origin of the various sections of the garden *Gladiolus* as I can draw up in a succinct form. The kinds raised in recent years in Europe and America, are legion. A great deal might be written as to culture and fertilising, and in description of the best varieties in each section, but I can only add a genealogical chart, which may be of interest.

the variety named "Golden Girl," one of several named varieties which we exhibited. At that time, so far as anyone knew, they were the first named hybrids which had been raised or exhibited. *The Times* of July 17, 1912, referred to our exhibits as being "real novelties," and the various horticultural papers of the same period spoke of them also in the same way, and gave us the credit for having originated the section. One of the notices in 1912 mentioned that we had exhibited them before the R.H.S. at a previous meeting. This was probably in 1910. The Royal Horticultural Society's report reads as follows:—"Award of Merit.—To *Gladiolus* Langprim hybrid strain (votes unanimous), from Messrs. Kelway, Langport. This

\* Reprinted from the *Year Book* of the British *Gladiolus* Society, 1927.

that is not the worst of the cultivator's enemies, but from the contingencies with which countrymen, as distinct from townsmen, have to deal. These contingencies are not all to be set down in black and white, for many are sporadic and some—like the frost of the last week of April, a May hailstorm or a spring and summer drought—may only recur at long intervals. None the less, they have to be reckoned with. It is not so many years, for instance, since a covey of partridges made a dust bath of a bed of some hundreds of seedlings of *Lilium Parryi* in my garden, with results better imagined than described, and once pheasants discover seedlings of the edible Lilies, which include many of the Chinese and Japanese species, they can be an intolerable nuisance, though less destructive, perhaps, than mice. Do what one will, an occasional hare or rabbit will find its way into a garden, and though these creatures usually relish the growing stems of adult Lilies, I have known them to eat down a bed of seedlings. Many gardeners, too, must have "had the cows in" at one time or another, over their seed beds. Slugs, again, as well as wireworms and millipedes, among other insects, are capable of serious damage to seedlings.

All these troubles and others can be brought much more readily under control in frame cultivation than in the open, but for commercial work the expense of the former is a consideration, and it is only in the case of seeds which are difficult to obtain that pan cultivation seems essential. Provided ample supplies of seeds are available, one may follow Nature and sow the seeds in the open, and if suitable precautions are taken, the inevitable wastage is not nearly so high as it is when Nature is left to herself.

It cannot be too often reiterated that frost has no harmful effect on the seeds of Lilies: on the contrary, germination usually seems better after a frost than when there has been none. Frost certainly does seedling bulbs no harm, and had we no experience of our own to guide us, the practice of the Eastern North American nurserymen would show the way, for in the winter months their pans or boxes of Lily seeds and seedling bulbs are frozen hard for months. The severity of the test may be gauged by this extract from a note sent to me by Mr. T. A. Weston a year ago. "The several sorts of Lilies were sown last spring and were later pricked out into boxes, these being sunk to the rim and stood in a flat, rough frame, eight inches deep, with glass sash. Heavy straw and bags were piled on after December freezing set in, and I saw no more of them till March was well in, when I found the Lilies still holding their seed leaves. In the same frame were many pans of Primroses and perennials. Eremurus seedlings, even *Primula kewensis* and *P. obconica* (Chenies strain), very small, survived, and several forms of Primrose seed had started germinating. Without doubt, every pot and box of soil was frozen solid and even below; the soil in the pots was literally heaved up an inch or more above the pot edges by the frost. I pressed it down later, but in many instances the pots were broken." I have often seen both seeds and bulbets frozen in this country without the smallest hurt, and have deliberately put them in the way of punishing cold; but when the young leaves of tiny, scarcely formed seedlings are cut down wholesale, just as they have speared through the ground, as they were in open beds at the end of last April, it is a different matter. However, perhaps even that calamity can be guarded against by intelligent anticipation, though most people seem to have been caught napping on the particular occasion. Branches of Pine or some other Conifer laid flat on the seed beds, and if necessary pegged down, make an excellent frost screen for Lily seedlings. Once the latter show their seed-leaves above ground the application of a mulch of leaf-mould is of little use as protection from frost, because of the risk of suffocating the seedlings; if applied before the seed-leaves appear, the object of the mulch is negated, because the leaves spear through the mulch and are at the mercy of late frosts. It is not the earth of the seed-bed which needs protection, nor the bulbets in it, but the tiny leaves themselves. If, however, a mulch is of slight use as protection from frost in winter

James Kelway.

## RAISING LILIES FROM SEED.

AFTER twenty years' advocacy of the propagation of Lilies from seed, it is refreshing to find the case for the practice so well presented, as in the communication from its latest recruit on p. 352.

It is the case, as Mr. George Taylor has found, that seeds of all hardy Lilies may be sown out-of-doors, though whether to better purpose than under cover depends upon circumstances. The main advantage in sowing in pans in a frame lies in the protection afforded thereby, not necessarily from the weather, for on the whole,

and spring, it is invaluable in a summer drought. Though climate and circumstances alter cases, it is generally wise, in the south of England, at any rate, to sow Lily seeds when ripe. In the case, for instance, of the June-flowering group, which opens the Lily season, the seed capsules usually begin to gape at the end of July. The precise date depends on the weather, and in some years it may be a fortnight later than in others; but if freshly ripened seed of *L. tenuifolium*, for example, is sown in the open in late July or early August, it will soon germinate like Mustard and Cress, and, given reasonable weather, the seedlings will finish their first growth before winter, beginning to grow again in the following spring. If the seeds are not sown until late autumn they may not germinate until the spring, unless the winter happens to be a mild one.

Germination undoubtedly depends, in some measure, on the ripening of the seeds, and that which is harvested in a dull, damp summer or autumn does not germinate so well or so quickly as it does in a roasting harvest time. In 1921—the last hot summer—seeds of *L. regale* sown in September germinated in three weeks, and the percentage of seedlings was exceptionally high. On the other hand, the crop garnered in 1925 was slow to germinate, and much of it came to nothing. The soil is warmer in the autumn than in the spring, and that helps germination, as anyone may see; on the other hand, seeds of Lilies sown in heat in a frame or house ultimately make no more rapid progress than that sown out-of-doors. As a genus, Lilies seem to resent any attempt at codling or forcing in the initial stages, and though bottom heat will expedite the actual date of germination in the case of some species, subsequent progress is no quicker than it is in the open, while casualties are far more numerous.

No matter when it is sown, the seeds of some species remain dormant for what is often loosely referred to as a year, and then only germinate in the spring. Actually it may be the second spring after the sowing, as we may see in the case of seeds which, though sown next August, do not germinate until the spring of 1929. The reason of this is not clear and though unable to be certain of it, I am under the impression that it is habitual with some species. As long as the seeds are plump they should not be discarded, and the thumb-nail will settle that point.

As that master-cultivator, Max Leichtlin, pointed out long ago, Lily seeds are usually covered with too thin a layer of soil, and provided the compost is suitable, a covering of half-an-inch is not too much. There is little risk of heavy rain or careless watering washing out seeds sown at that depth, either out-of-doors or in pans.

Seminal propagation is not the only method of raising Lilies, and when it is desired to propagate hybrids or varieties which are not fixed, it is useless. In such cases, propagation by offsets, bulb scales or stem cuttings is a sure method, and the offspring is then a replica of the parent.

In answer to the enquiry from Mr. Carruthers on p. 417 as to the germination of *L. regale* seed, I do not think I can usefully add anything to the original account on p. 302 of a test of a sowing of this seed in two parallel beds, with and without manure. There is nothing abnormal in the flowering of *L. regale* in the year in which the seed is sown, and the point has been noticed by others besides myself. The proportion of flowering seedlings in the first year, however, is as small as the plants themselves. They are seldom more than eight or nine inches high, with a single, small flower. If the season is propitious, a capsule—also small—will follow the flower, and if the seed in that is ripened and sown, it may develop a flowering bulb or two in the following year; so that one may have two generations of small flowering bulbs in as many years.

The germination of Lily seeds out-of-doors is undoubtedly affected by the weather. In the dull, inclement spring of 1926, germination was most unsatisfactory, and it is not much better under almost the same conditions this year. *A. Grove*.

## SULPHATE OF AMMONIA AND BOWLING GREENS.

I READ with interest the article "On Lawns" (*Gard. Chron.*, March 19, p. 187) regarding the use of sulphate of Ammonia for American lawns. Before the use of such large dressings of sulphates are tried in this country, some data of the circumstances in which they were used in America would be necessary, as the climate, rainfall and physical and chemical conditions of the soil vary greatly in different parts of that continent.

In the Glasgow district, where the soil is mostly clay or of a heavy nature, and there is a rainfall of forty-two inches per year (in some wet months a fall of four or five inches), no green-keeper would care to tackle the result of a dressing of one-and-a-half hundredweight of sulphate of ammonia per acre per fortnight.

Here, where a hard-wearing turf on bowling greens is essential throughout the playing season, the use of sulphate of ammonia has been practised for some time past. The success of the treatment has been such that during the hottest and driest spells of last year our greens were quite green and finished the season in perfect order. Each green is 126 feet by 126 feet, laid level, with a ditch round, and well-drained. The turf was obtained from Cumberland and Ross-shire, the Cumberland turf a good loam and the Ross-shire turf a peaty mixture. The grass was originally mostly a *Festuca*, with a good lot of Sea Pink in it. The Sea Pink generally dies out the first season, leaving bad, brown patches.

During the spring treatment the greens are lightly dressed with a bowling green mixture of seed obtained from a reliable source. This has overcome successfully the loss of the Sea Pink and other maritime plants that may have been in the original turf, so that with local grasses that have established themselves in the greens we have a sward of a very composite nature, but under our treatment a good-wearing one for public service.

The soil being naturally acid and the rainfall heavy during winter and spring a badly-worked green would soon become sour, quite different from a green well-worked and an acid balance kept in it. We keep our greens aerated by thorough piercing, and this is done by a special piercing fork which has four prongs, about four inches apart, of half-inch, rounded steel, usually eight to nine inches long when new; the handle arises between the two centre prongs as in a common garden fork, but without a bend, being perfectly straight, with a T-handle at the top. The green is pierced by this tool in the autumn, the method being to start in one corner of the green and to work diagonally across in rows about six inches to a foot apart. The greens are sanded with seaside (wind blown) sand at the rate of four to five tons per green, and dressed with three hundred-weights of bone-meal per green. Nothing more is done until March, when the greens are thoroughly harrowed. This piercing and harrowing I contend to be essential to check any sourness, fairy rings and moss that may be due to excessive rainfall, undue rolling or over-dosing with manure.

The harrow is one of the best eradicators of Clover and prepares the surface of the green for the spring dressing of grass seeds where this is necessary because of a thin sward. The type of harrow used here is a piece of wood four inches by two inches by five feet (Fig. 212). Into this is fixed the teeth made out of four-inch wire nails, the ends of which are heated and flattened into a blade for about one-and-a-half inch up. The driving head is cut from the nail so that it may be driven into the wood until it protrudes right through, thus enabling the teeth to be driven back a little when they wear. The teeth are fixed in three rows, one-and-a-half inch apart in the rows, with the edge of the blade towards the worker, but so fixed that each tooth takes its own course, thus giving a line of scratches half-an-inch apart the full length of the five feet. To this arrangement is fixed a handle six feet long, and set at about 30°. A T-piece at the end allows two men to pull the harrow

along, after it is weighted with a small bag of sand to make it bite into the green. The greens are harrowed straight both ways and diagonally both ways, and a mowing machine follows, with a box to pick up what is torn up; or else the green is swept. This treatment is repeated if the greens are infested with Clover or moss. A good dressing of artificial grass manure is given, about two hundredweights in all, one hundredweight at a time, the last hundredweight being applied two weeks before the opening of play, usually in May.

Throughout the playing season a dressing of 7 lb or 8 lb of sulphate of ammonia is given each green every two or three weeks, and watered in. This works out at one-and-a-half hundredweight per acre during the playing season, from May to September, and we have proved that it keeps our rinks perfectly green, and enables them to wear well—and everyone knows the abuse a public green gets.

For private greens, where a keener surface is demanded, a green-keeper who used ammonia would also require to be a good scytheman. To get his greens close down for keen play a scythe must be used, but a good scytheman with a special sned and correctly-set blade would, on a dewy morning, cut a green in two or three hours. Scything should be followed by the mowing machine, with the box on, to pick up the grass. Sulphate of ammonia does not appear to penetrate deeply, but it stimulates the finer top grasses, giving them power to overcome the coarser and deeper-rooted weeds and grasses. Where time permits, a pinch of ammonia set in the middle of a Daisy or Plantain will kill it outright. This, however, will leave a patch in the lawn for a while, but the grass soon grows over it with astonishing vigour, stimulated thereto by the ammonia that killed the Daisy.

On tennis lawns and lawns where clover is prevalent a good harrowing and a dressing of sulphate of ammonia during showery weather, would soon help the grass to overcome the Clover. Of course, piercing need not be done every year unless any effects caused by stagnation are evident. Heavy watering by a hose or other means on lawns that have been turned up in dry weather is of little avail; in fact, one may sweep up baskets of dried grass washed off the sward by such waterings, and in a day or two the lawn is as dry as ever. A small dressing of sulphate of ammonia retains the moisture and if previous dressings have been given, so much the better, as I think the deliquescent nature of sulphate of ammonia enables the soil to hold the moisture. Care should be taken in using sulphate of ammonia, as great damage may be done by careless distribution, over-dosing, and not using sufficient water to dissolve it. *W. G. R., Glasgow*.

## SEASONAL PESTS AND THEIR CONTROL.

### WHITE AND GREEN FLY UNDER GLASS.

THESE two pests have appeared somewhat early this year, in spite of the exceptionally unfavourable weather during the spring. Undoubtedly the best method of keeping them in check is to destroy them in the early stages before they have had time to spread.

Fumigation is now generally considered to be the most satisfactory method for eliminating pests under glass, owing to the fact that the vapour or gas used will permeate all parts of the house and destroy the creatures.

In the early stages, however, when the plants are on the young and tender side, the grower has to decide whether it is desirable to fumigate a whole house in order to kill a few flies, or adopt some other means for preventing them from spreading. For this purpose either spraying or dusting is to be preferred.

Undoubtedly, dusting is the nearest to fumigation and may be applied to small, localised patches. A dust containing two to three per cent. nicotine incorporated with an inert material, such as lime or gypsum, and applied by

means of an ordinary dusting machine, of which there are large numbers on the market, would be found quite suitable. When spraying, a nicotine wash is to be preferred.

The destruction of green fly is not a difficult matter, but in the case of white fly, once it is disturbed it rises from the plant, therefore dusting is the most satisfactory method in this case.

Many fumigants may be successfully used. Nicotine, at the rate of one-eighth to one-quarter ounce per 1,000 cubic feet, vapourised, in a suitable pan placed over a spirit lamp, night lamp, etc., has been found very successful. Another useful modification is Tobacco shreds or paper. This consists of paper which has been impregnated with saltpetre containing nicotine and then allowed to dry. The former material helps to make the paper smoulder, thereby vapourising the nicotine. Usually these shreds are manufactured to contain thirteen to fifteen per cent. nicotine, and one pound is sufficient to treat approximately 20,000 cubic feet.

It is questionable whether nicotine by either of these methods would be effective in controlling white fly; it is only susceptible to certain chemicals in the same way as green fly.

Tetrachlorethane, which is familiarly sold as white fly fumigant, is only specific to white fly; it does not appear to affect green fly. For the former pest it is used at the rate of two-and-a-half to five ounces per 1,000 cubic feet of space, either by impregnating sheets of canvas suspended from the wires, or by sprinkling it on to heaps of coke or other absorbent material contained in seed-boxes or trays. It is most important that this fumigant be kept out of the soil. The old method of sprinkling it along the central path of the house is to be highly deprecated, owing to the fact that the material does not decompose in the soil, and remains for a considerable period of time, making the soil absolutely unsuitable for growing purposes. When using this chemical it should be carefully noted that certain plants are particularly susceptible to its fumes, and it should not be used under any circumstances in houses containing Chrysanthemums or Cinerarias; there are other plants which are only partially affected.

For the general fumigation of glasshouses, both commercially and otherwise, cyaniding is advocated, although with an effective material, such as cyanide, it must be remembered that the margin of safety is very much smaller than with less effective chemicals.

Undoubtedly calcium cyanide is to be preferred to the old-fashioned sodium cyanide used by the pot method, simply because it gives off its gas slowly in the presence of atmospheric moisture and carbon dioxide; secondly, the plants are not subjected to very sudden concentrations of hydrocyanic acid gas, as in the case of the sodium cyanide method.

It must also be remembered that no matter what fumigant is used, it will always produce a seen or unseen checking influence upon plant growth, because it produces an unnatural environment. Therefore it is far better to adopt the method of small doses at frequent intervals.

Calcium cyanide is commonly used at the rate of a quarter-of-an-ounce per 1,000 cubic feet, but this requires modifying according to the period of the season when the cyaniding is done. Theodore Parker.

## MARKET FRUIT GARDEN.

THE drought has been very severe in my district, only 0.95 inch of rain having fallen in seven weeks. The rainfall of May was 0.82 inch, and this fell in such light showers that the ground was scarcely moistened. It was so hard, indeed, that no cultivation has been possible amongst bush fruits, beyond mere scratching of the surface with hoes to kill weeds. In spite of this, the drought has not done so much harm as might have been expected. Black Currants and Gooseberries certainly look as though they needed rain, as the leaves are poor in colour; but they are holding their fruits so far and the latter are swelling normally. No doubt there is a good deal of moisture in the

ground after the heavy rains of March, but one would have expected it to dry out quickly by evaporation in the absence of good surface cultivation. Possibly the avoidance of root disturbance is ample compensation. As for tree fruits, these have not suffered from the drought; in fact, they are particularly clean and luxuriant.

### FRUIT PROSPECTS.

The full extent of the damage done by the late April frosts can now be stated. In the case of my plantations, probably owing to their proximity to the sea, the injury was not so serious as in many places, though bad enough. Victoria and Pond's Seedling Plums were practically wiped out. Czar and Rivers' Early Prolific

seventy-five per cent. of their bloom and Strawberries about the same. Taking the country generally, the extent of the damage by frost in market plantations was very extensive. In most of the principal fruit-growing districts it may be said that the only plantations that escaped were those situated near the sea or some 300 feet above sea level. The orchards visited on the occasion of the recent National Farmers' Union's tour of fruit farms in mid-Kent demonstrated the importance of situation in connection with frost injury. On the lower ground prospects are distinctly poor, whilst some of the plantations on the hillsides promise to give good crops of Apples and even, in some cases, a fair yield of Plums. Cob-nuts appear to be a failure.

FIG. 212.—HARROW USED ON GLASGOW BOWLING GREENS.

(see p. 436.)

escaped, and will constitute almost the whole of the Plum crop, which will therefore be very light. These two varieties have set well, and the fruits appear to be stopping on. Pears are a failure, with the exception of Fertility, though there was no apparent injury to the bloom. Cherries, which I do not grow on a commercial scale, have set a good crop. Apples were not harmed, unless the somewhat light setting of Beauty of Bath, after profuse blooming, can be attributed to low temperature. Worcester Pearmain looks very promising, and other dessert varieties will carry satisfactory though not heavy crops. Almost all cooking varieties show good promise in my plantations, including Bramley's Seedling, which suffered severely from frost in many other places. Turning to bush fruits, Black Currants, my main crop in this department, look promising, but need rain urgently. Only in a few low-lying spots was the bloom destroyed by frost. Gooseberries were not so fortunate, Whitesmith being almost entirely cleared off, whilst Careless suffered much less. These remarks apply to my own plantations only. In low and exposed positions in the district much more damage was done, Black Currants, in some cases, losing

### APPLE SCAB AND MILDEW.

I should be disposed to complain more about the drought if it had not done me one very good turn; it has held Apple scab in check as nothing else could. My weather records show that Apples are clean in seasons when we have a dry May. It was so in 1922, when the rainfall of the month was only 0.56 inch, and in 1919 when it was 0.25 inch. In the year of the great drought, 1921, there was a lot of scab; but then the May rainfall amounted to 1.33 inch. Even where no spraying has been done there is very little scab to be seen so far. For all that, I do not regret having carried through my own programme of spraying, for mine is a bad district for scab, and there are signs that it would have developed to some extent if no preventive measures had been taken. A few spots of the disease can be found on the earliest leaves, but obviously suppressed by the Bordeaux mixture still to be seen on the surface. One row of Beauty of Bath (not a particularly scabby variety) which I left unsprayed, shows a good deal of the disease on the first leaves; but, so far, it has not spread to the fruit. For the second spraying, given just after the fall

of the petals, I used lime-sulphur with arsenate of lead throughout, giving up the idea of using excess-lime Bordeaux mixture on such varieties as will stand it. It is a nuisance to have to change about from one wash to another as the work proceeds; and I decided to play for safety by employing very mild washes. Most varieties had lime-sulphur at one in eighty, and Cox's Orange Pippin and Beauty of Bath at one in 100, in both cases with arsenate of lead, which increases the fungicidal value as well as serving to kill caterpillars. Up to the present, neither wash seems to have done any harm. I shall carry the programme right through by giving a third spraying with the same washes about three weeks after the last, in the case of those late varieties of dessert Apples which are particularly liable to scab. Even if this is not necessary to protect the fruit, it may be expected to do much good by keeping scab off the young shoots, and so helping to prevent a bad attack next season. I think it is a mistake to omit spraying against this disease just because we have a little dry weather. It is surely better to regard such a season as a grand opportunity to gain the upper hand over scab, since the results of spraying are known to be cumulative.

In one plantation lime-sulphur has been used throughout. The control is just as good as where Bordeaux mixture was employed for the pre-blossom application. Owing to the favourable nature of the season for scab control, it would probably be unwise to conclude that this might always be expected to answer as well, though there is a great temptation to do so. For one thing, the preparation of Bordeaux mixture is troublesome on a large scale, and ready-made preparations are useless and dangerous. Then there is Apple mildew to be thought of; and lime-sulphur is a much better preventive of this than is Bordeaux mixture. Mildew has been growing more formidable for several years; and this season there is more of it than I have ever seen before. When it attacks only a few shoots here and there, as it used to, it does little harm; and it is not a big matter to cut off the affected shoots and burn them. But it can increase until it becomes a serious disease, dwarfing the tree and spoiling the fruit. Early spraying with lime-sulphur gives the best control. The plantation referred to above is quite free from mildew this year. Bismarck is commonly one of the worst varieties for mildew, but this year the trouble has appeared on many varieties, notably Newton Wonder.

#### APPLE BLOSSOM WEEVIL.

Apple bloom was so long in the bud stage this year that it is not surprising that a considerable proportion of the blooms should have been capped by Apple blossom weevil. It is remarkable that so little fuss is made by growers about the damage caused by this pest. When some seventy per cent. of the bloom is lost through frost there is a great outcry; but not when, as often happens, weevil causes similar loss. In a year like the present, when bloom was very profuse, the weevil damage does not matter much, except where frost has already taken a heavy toll. It may even be considered as an advantage, as it obviates the need for artificial thinning. The weevil is generally obliging enough to leave one fruit to a truss; and that is about all it has left on some varieties this season. The amount of fruit hanging singly in my plantations is quite surprising. At present, I think, it makes the crop look smaller than it really is. When the Apples have swelled out, I fancy they will present a very pretty sight, as they seem to be evenly disposed over the trees and are unusually clean, regular in shape, and uniform in size. In a season when there is little bloom, however, the weevil is an unmitigated evil. Unfortunately, there is no real practical method of controlling it. Sacking bands properly fixed around the stems of the trees trap a large number of the insects; but I do not think that the pest has even been noticeably reduced in any orchard by this laborious method. The only thing that does make a wholesale clearance is the running of ducks under the trees. A neighbour's plantation in which Indian Runner ducks have been penned thickly for two or three years, is prac-

tically free from weevils, although there used to be plenty before the ducks were introduced.

#### RING BARKING.

Growers in the Wisbech district are much interested in the practice of ringing fruit trees with the object of bringing them into bearing. In that locality growth is apt to be sappy and excessive; and it is found that ringing reduces vigour and brings the trees into bloom in the season following the operation. A ring of bark, right down to clean wood, is taken off half way round the stem. A few inches lower down another half-ring is removed, on the opposite side to the first. The space between the two rings should be about equal to the thickness of the stem or branch being treated. In the case of very vigorous trees the rings are made rather more than half way round the stem, as it is found that, the more the ends overlap, the greater the reduction in vigour. The work is done during May, and is said to be useless if tried later. The practice is old, of course, but the method seems to be new.

#### PRUNING RED CURRANTS.

The training of Red Currants up to bearing age by the usual methods seems to me to be a slow business. I have been trying for three years to produce large bushes from material which was none too good when it came from the nurseryman. Last winter, when they were pruned, I thought that, at last, they would begin to reach a fair height and begin to carry useful crops, as there were plenty of clean shoots to serve as leaders. I now find, however, that in most cases they have failed to shoot from the buds to which they were pruned, but are shooting instead from lower down. I had just concluded that the orthodox method of pruning Red Currants was mistaken, when a grower who specialises in bush fruits, and grows them thoroughly well, happened to mention that his Currants this year are behaving in exactly the same way, a thing he has never known before. I suppose, therefore, that the peculiar season is to blame. For all that, I am not at all sure that the bushes could not be formed more quickly without so much shortening of the leaders. They must, of course, be cut back when first planted; but once the required number of leaders has been obtained, I see no reason why they should not be allowed to extend full length, without tipping, for a few years. There is no object in getting spurs to form close to the ground, as the fruits get too soiled to be of any use. The main thing, it seems to me, is to get the branches well up into the air before they begin to fruit. Once the bushes have begun to bear, the orthodox annual severe shortening of leaders and spurring of all laterals is quite likely correct, if only because it produces large fruits and a crop which is easy to pick. At the same time, I have noticed that bushes which are grown more naturally crop remarkably well. *Market Grower.*

### WALNUT LEAF EXTRACT AS AN INSECTICIDE.

SOME while ago, I called attention to the use of infusions of Walnut leaves by our forefathers in destroying insect pests. In the recently issued *Catalogue Descriptif* (1927) issued by the Société Pomologique de France (p. 362) the same substance is recommended for the destruction of the root form of the Woolly Aphis (*Schizoneura lanigera*), as follows, when translated:—"For destroying the colonies which have hibernated on the roots, it is advised to dig out a sufficiently large basin around the tree in March, and to water the area with a very strong decoction of Walnut leaves, finally to place the residue of the leaves which have made the decoction into the dug out basin. Thus perfect results have been obtained on strong cordons by using five litres (rather more than a

gallon) of decoction; this dose may be increased according to the size of the tree."

Evidently the leaves must have been collected the previous season, for in the South-west of France, and even so far south as Majorca, Walnut trees have not yet broken their leaf-buds at the end of March. *H. E. D.*

### ROSE GARDEN.

#### SOME GOOD NEW AND NEWER VARIETIES OF ROSES.

WITH the ever-increasing addition to the number of new Roses the grower is bewildered as to what varieties to select for his garden. The following Roses have all been introduced during the past few years, and in my opinion they are all worthy of planting. Most of them are hardy and vigorous in growth, whilst the colours and fullness of the blooms are in every respect satisfactory. Although situation, soil, and district have a great deal to do with the success of Rose growing, all the undermentioned varieties will succeed in most gardens.

Lord Lambourne is a variety of vivid colouring; buttercup yellow, the petals being margined with carmine-scarlet, similar to Sunstar. The flower is of perfect contour, of immense depth and large of petal; it is a useful Rose for all purposes.

Betty Uprichard is very popular and grown extensively. The colour is a delicate salmon-pink passing to carmine, the reverse of the petal being glowing carmine, with a coppery sheen and a suffusion of orange. The bloom is sweetly perfumed and makes an ideal flower for vase or table decoration.

Lord Charlemont is a large, full, crimson bloom; the variety is useful for massing and supplying cut blooms. It is a Rose of strong constitution.

Lady Inchiquin is a superb Rose; the colour is orange-cerise. The plant makes strong growth and crops freely. The blooms are full, perfect in shape, and sweetly perfumed; it is a splendid decorative variety.

Hawthorn Scarlet may be highly recommended as a garden and decorative Rose. The flowers are of medium size, sweetly scented and of a brilliant colour; this variety is in bloom until late in the autumn.

Angèle Pernet is a Rose of remarkable colour—vivid orange-yellow, shaded deep reddish apricot and fiery golden yellow. The blooms are sweetly scented, the growth clean and strong. It is a very fine addition to the Rose garden.

Lady Sylvia is a highly-coloured Madame Butterfly, with similar growth and shape to Ophelia.

Scarlet Glory is a very vividly coloured Rose, and will comply with satisfaction to all requirements. It is a splendid variety for bedding purposes and withstands wet weather much better than most Roses.

White Ensign is white, flushed with delicate cream at the base of the petals. When cut the blooms remain fresh in water for a long period.

Shot Silk is a bedding Rose of great merit. The colour is bright cerise, overshot with salmon-orange, flushed with rose and veined with buttercup-yellow. The growth is vigorous and clean.

Mrs. Courtney Page is a superb variety. It is sweetly scented and coloured orange-cerise, with carmine shadings; the flowers are large and have petals of great substance. The plant is of strong growth. It is an ideal Rose for all purposes and should be planted in every garden.

Captain F. S. Harvey Cant is not so generally known as its merit deserves. The blooms are ideal in every respect and charming in colour. The growth of the plant is strong and clean. The flowers are carried on long stems which makes them very suitable for arranging in vases, etc. The colour is rich salmon-pink, veined

scarlet and suffused with yellow. It is a charming Rose with every good quality.

Florence L. Izzard is a Rose of strong growth with beautiful, glossy foliage. The blooms are of a deep buttercup-yellow, long and pointed, of fine substance, perfect in form and highly fragrant. It is one of the best yellow Roses in cultivation.

Rosemary is a beautiful variety of deep carmine and old gold colour, with a Damask perfume, a Rose of sweet fragrance. *G. L.*

## FRUIT REGISTER.

### PEAR MARGUERITE MARILLAT.

If this Pear were of no value as a comestible, it might well be grown for its truly beautiful appearance; the very large, almost enormous fruits are uneven in outline, pale clear yellow with scarlet flushing. The flesh is pale yellow, juicy, and quite pleasant to the palate, although real excellence of flavour cannot be claimed for this showy variety. The fruits ripen during September and are improved by gathering and storing before they part readily from the tree.

The tree is of upright, vigorous growth, and should be subjected to hard pruning; it makes a good bush, and as a trained specimen will produce excellent fruits of gorgeous colouring. It is a regular cropper.

It is not a very old Pear; it was raised in France about 1870, by M. Marillat, a nurseryman. *A. E. R.*

### APPLE BELLE DE BOSKOOP.

This Apple is of Dutch origin, and was introduced to this country about the middle of the last century. It is usually classified in nurserymen's catalogues as "culinary or dessert," and as it is in season from December to April, it is very useful for the latter purpose. Although the fruits are inclined to be rather large, they are of handsome appearance, having a ground colour of golden yellow, partly covered with russet and generally flushed with red on the sunny side. The flesh is crisp and of good flavour.

The tree is of moderate growth and makes a good bush; it is a free cropper, and may be highly recommended for the garden. *J. Wilson, Wisley.*

## VEGETABLE GARDEN.

### HOEING BETWEEN CROPS.

STRICT attention should be given to the hoeing of the soil between crops. This operation is, in conjunction with deep tillage, the primary secret of successful vegetable culture. By the loosening of the surface soil fertility is increased and, paradoxically, the soil becomes drier on the surface and also retains more moisture below. Thousands of seedling weeds are destroyed by the operation, while many diseases are prevented and attacks by insect pests rendered less liable.

By the destruction of weeds the gain in the saving of plant food is immense. Hoeing should be performed with systematic regularity, as frequently as the weather permits; hoe deeply wherever possible. Strengthening of the crops will be noticed almost immediately where persistent hoeing is practised.

Seed-sowing on heavy soils this season has had to be accomplished, in the majority of cases, on lumpy seed-beds. In the Home Counties the effects of frost during the early spring was of little avail in rendering the soil friable owing to the abnormally heavy rainfall experienced during the latter part of February, March and early April. The soil was beaten down flat and hard, and in nearly all cases necessitated re-digging. The east winds which followed and the resultant dry weather necessitated hard labour to break down the soil sufficiently for sowing.

After sufficient rain has fallen to soak the soil through, all parts of the garden should be hoed. Hard lumps will then fall to pieces quite easily. *James A. Paice.*

### LEEKES.

THE Leek is one of the hardiest of vegetables and useful for cold localities, being a general favourite both in Scotland and in the north of England. Although it may be had in season from August to May, it is during the coldest part of this period that Leeks are in the greatest demand. This vegetable is not subject to any serious pest or disease and is obtainable at a time when many other vegetables are not in season.

The soil for Leeks should contain plenty of manure; land of a moderately light nature is best for although the Leek delights in plenty of moisture, it will not tolerate stagnant conditions. For early supplies a small sowing may be made under glass, and the seedlings treated in the same manner as Onions raised in warmth. Plant the seedlings in the open when they are large enough to handle and have been suitably hardened.

For ordinary purposes one sowing in the open is usually sufficient. Sow the seeds in a seed-bed from early to mid-March. The plants from

holes with a dibber about six inches deep, dropping a plant in each hole, placing a little soil in to cover the roots, and completing the operation by filling the hole with water. Which ever method is adopted, watering should be done thoroughly in dry weather.

Several distinct types are represented in the different varieties of Leeks; these differ in season, the colour and formation of their leaves and length and thickness of the stem. One of the longest is International Prize, an excellent variety for exhibition and autumn or early winter use. The Lyon is of outstanding merit for ordinary purposes; an improved form of this variety, named Goliath, received the R.H.S. First Class Certificate in a trial at Wisley during the winter of 1922-23. Another fine variety is Royal Favourite, which was raised at Frogmore by the late Mr. Owen Thomas. By reason of their hardiness and long standing qualities the last mentioned, Musselburgh and Prizetaker are admirable varieties for furnishing late supplies. *J. Wilson, Wisley.*

FIG. 213.—MESSRS. DOBBIE AND CO.'S GOLD MEDAL EXHIBIT OF SWEET PEAS AT CHELSEA SHOW.

(see p. 379.)

this sowing are usually ready for planting towards the end of June or early in July on land which has been properly prepared. There are several methods of growing Leeks, and these depend upon the purpose for which the crop is required. Extra fine stems are obtained by growing the plants in trenches in much the same manner as Celery, with the exception that the trenches need not be more than two-and-a-half feet from centre to centre. Plant the seedlings from ten inches to twelve inches apart, and so soon as the plants have grown large enough, place a little soil in the trench and more as the plants develop. Under this treatment it is possible to produce well blanched stems from twelve inches to fifteen inches long. To obtain Leeks for exhibition, even more elaborate methods are employed.

Good Leeks for ordinary purposes may be produced by simply drawing drills with a large hoe, about five inches deep and eighteen inches apart. Place the plants ten inches apart and by frequent hoeing the drills will be gradually filled in; later in the season a little soil may be drawn up to the stems to blanch them. Another method is to plant on the flat, simply making

## HOME CORRESPONDENCE.

**Dahlia Coronata.**—I am anxious to obtain plants of *Dahlia coronata*, but so far have been unsuccessful in my attempts to find anyone who still grows it. I should be most grateful to hear from any or your readers who know where this plant can be obtained. *W. Lawrence, The John Innes Horticultural Institution, Merton Road, Merton, S.W.19.*

**Laburnum Adamii.**—The recent sharp frosts destroyed all *Laburnum* blossom throughout our garden. This is shown remarkably on *Laburnum Adamii*, where branches of pure *Cytisus purpureus* and of the *chimaera*—the yellow-purple *L. Adamii*—are in full flower, but every spray of pure *L. vulgare* has been cut. *William Lawrence, Burford, Dorking.*

**The Codlin Moth.**—The small maggot which is found in Apples is the larva of the Codlin Moth, and the damage it does is very considerable throughout the country. When, however, there is a very short crop or total failure, the numbers

of the moth must be greatly reduced, having no homes to go to. So far as I have seen this year, there are very few eggs, and it would be of the greatest value if amateur fruit growers would look over their young fruits and gather and burn at once any which show signs of attack. We should thus catch the moth when its numbers are few and reduce very considerably the possibilities of attack next year. The caterpillar enters usually at the eye, and a small hole will be found from which the brown, powdery frass is exuding. These are the affected fruits which should be removed and immediately destroyed. As the thinning of fruits should now be attended to, I send this note to suggest that good work in disease prevention may be accomplished at the same moment. *Edward A. Bunyard.*

**A Large Auricula Inflorescence.**—Amongst a batch of two-year-old seedling Auriculas one plant has flowered this year for the first time, producing a truss of tremendous proportions to the size of the plant, which only measures three inches across. The colour is violet-blue with a yellow centre. The spike grew to the height of five inches and developed no fewer than seventy-two individual flowers, each measuring on an average three-quarters-of-an-inch across, the spike itself being one-and-three-quarter-inch in circumference. I wonder if this is anything like a record for Auriculas. The plants have received no feeding whatever, but were given a good dressing of leaf-mould in February. *F. Glass, Greyhouse Gardens, Murrayfield Road, Edinburgh.*

**Watercress.**—Other gardeners may, as I once was, be called upon to keep the table supplied all the year round with Watercress, and this I was able to do by adopting similar methods to those described on p. 366, except that I had to start with, and continued to use, cuttings throughout the periods when cutting from plants in the open was not possible. The cuttings were inserted in ordinary seed-boxes placed in a Melon house, and when rooted, hardened. The cut backs kept me supplied with cuttings for future batches. Watercress grown in this way does not have the bitter taste which makes Watercress unpalatable to some. *A. J. Elgar.*

**Deterioration of Strawberry Plants.**—Your leading article on Strawberries, in the issue for June 11, p. 405, contains two or three simple statements of fact which might usefully be elaborated a little, and followed up by the anxious gardener. In the first place you remark on the necessity on the part of the cultivator, of a knowledge of the habit of growth of the plants he handles. He should also know something of the plant's natural habitat and surroundings. In the case of the Strawberry, its habit of producing new roots above the old is inherited from its woodland ancestors, which are annually half-buried in a layer of decaying leaves that provide an excellent rooting-medium. It seems to follow then, that the correct treatment would be to apply a good mulch in August, largely composed of leaf-soil, and packed well around the crowns. In gardens where the beds can be kept moist, such treatment would prevent the suffering and semi-starvation to which the plants are often subjected at this period, owing to their inability to find moisture and anchorage for their new roots. The critical point in the Strawberry's year is during dry periods in late summer, a time when, in many gardens, it is left to struggle on as best it may, instead of being assisted to prepare for next year's crop. You also hint at the necessity of an annual rest. Recent observations seem to suggest that the cultivated Strawberry tires of its highly civilised existence and desires an occasional complete rest—an opportunity to run wild and undisturbed for a period, to retain its runners and to colonise. During this "rest" the plants appear to recuperate and regain much of their former health and vigour. The healthiest and most vigorous plants I know at the moment were taken, last year, from an old, neglected patch which has been untended for some years, and this is not an isolated case, as I found a similar occurrence last year in the Midlands. I am also watching, in a corner of

Surrey, a plot of waste land which was once a garden, but is now overgrown and neglected. Here a patch of Strawberries, apparently untouched for several years, and entangled with herbage of every description, appears to be in perfect health, and the plants are bearing an abundance of flowers and well-formed fruits. The berries, I fear, will not be allowed to mature, but I hope to get stock from this patch later, and shall look forward to the result with confidence. I am not attempting to offer an explanation of this natural tendency to recover, but the fact is obvious, and it would be interesting to know if other readers have made observations in this direction. *C. H. Middleton.*

## FOREIGN CORRESPONDENCE.

### INTERNATIONAL COMMITTEE FOR HORTICULTURAL CONGRESSES.

In *Die Gartenwelt* (XXXI, April 29, 1927, p. 262), the following is announced.

"France. The Société nationale d'Horticulture de France has sent out invitations for an International Horticultural Congress in Paris. It will be known that the Austrian Horticultural Society on the occasion of its hundredth anniversary, is organising in September, 1927, an International Horticultural Congress, while the International Federation of Professional Horticulturists intends to hold its yearly meeting this year at Geneva. So the *Schweizerische Obst- und Gartenbauzeitung* is quite right in criticising this international competition of horticultural congresses and in recommending the intervention of a committee for international arbitration."

I should like to make a few remarks on this notice:—

Such an arbitration-committee exists in the International Committee for Horticultural Congresses, in which most European governments are officially represented. The competition mentioned above has received the full attention of this International Committee; we can only regret that the organisation of the Paris congresses has been planned without knowledge of our Committee, and hope that in future all societies that intend to convene international gatherings will apply to the International Committee, so as to avoid such coincidences. The Committee will co-operate with the yearly meetings of the Federation of Professional Horticulturists; while these are considering only economic and commercial problems, the congresses (probably every third year) will take up a programme of cultural, scientific and educational questions.

The existence of this International Committee and of the International Federation of Professional Horticulturists makes thus the creation of an International Arbitration Committee unnecessary. *Dr. M. J. Sirks, Hon. Secretary, The International Committee for Horticultural Congresses, Wageningen, Holland.*

## PUBLIC PARKS AND GARDENS.

THE Ministry of Health has held an inquiry into an application by Barry Urban District Council for sanction to borrow £15,650 for the purchase of Porthkerry Park.

THE Golden Valley, Hindhead, a well-known beauty spot, which was given its name of "the Golden Valley" by the late Mr. Grant Allen, and can be seen to full advantage by travellers on the Frensham Road, was lately put up to auction at Guildford and was only saved, it is understood, from being parcelled out for building purposes by the action of a public-spirited Hindhead resident, who bought the property with a view to gaining time for raising a fund by public subscription for the purchase of the land for the nation. The area is about ninety-six acres, and the price paid was £5,650. It is stated that the National Trust has been approached on the matter and requested to issue an appeal for funds.

## SOCIETIES.

### MANCHESTER AND NORTH OF ENGLAND ORCHID.

At the meeting held on Thursday, May 5, the members of Committee present were Messrs. J. B. Adamson (in the chair), R. A. Ashworth, A. Burns, A. Coningsby, J. Evans, A. Keeling, J. Lupton, D. McLeod and H. Arthur (Secretary).

#### AWARDS OF MERIT.

*Odontioda Brew-nobia* (*Zenobia* × *Brewii*); *Phaius Cooksonii grandiflora*; *Odontoglossum Gorizia* var. *Purple Emperor*.—From J. B. ADAMSON, Esq.

*Odontioda Llewelynii* (parentage unknown); *Odontoglossum crispum* var. *G. V. Llewelyn*; *Odontoglossum Doreen* var. *The Prince*.—From G. V. LLEWELYN, Esq.

*Brasso-Laelio-Cattleya Everest*, *Beardwood* var.; *Brasso-Cattleya Enchantress*, *Beardwood* var.—From Col. Sir J. RUTHERFORD, Bart.

*Miltonia Lucia* var. *Fidelio*.—From Mrs. BRUCE and Miss WRIGLEY.

#### AWARD OF APPRECIATION.

*Miltonia vexillaria purpurea*.—From G. V. LLEWELYN, Esq.

A Cultural Certificate was awarded to Mr. J. Howes for *Phaius Cooksonii grandiflora*.

#### GROUPS.

Mr. J. B. ADAMSON staged a group, to which a Gold Medal was awarded, of *Odontoglossums* in variety, including *Odontoglossum Gorizia* var. *Purple Emperor*, *Odontoglossum Crisp-Solon* var. *Rex*, *Odontoglossum Doreen* var. *Queen of the Belgians*, and *Odontoglossum Colossus*; *Odontioda Brew-nobia*, *Odontioda Gladya superba*, *Odontioda Leana* and *Odontioda Joan*; *Coelogyne Mooreana*; *Oncidium Marshallianum*; *Broughtonia sanguinea*; *Miltonia Lena*; *Masdevallia Houtteana*; *Cattleya citrina*; *Cypripediums* in variety and others.

G. V. LLEWELYN, Esq., Southport, was awarded a Large Silver Medal for a group of *Odontoglossums* in variety, including *O. Doreen* var. *The Prince*, *O. crispum* var. *G. V. Llewelyn*, and *O. Margarita*; *Odontiodas Latonia* and *Llewelynii*; *Miltonias vexillaria purpurea*, *bleueana rosea*, and *Venus* var. *Princess Maud*; *Brasso-Cattleyas Ajax* and *Empress of Russia* var. *delicata*; *Cypripediums Lilian Greenwood*, *Enchantress* and others.

Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), staged a group, to which a Silver Medal was awarded, of *Odontiodas* in variety, *Miltonia Lucia* var. *Fidelio*, *M. vexillaria Oswaldii*, *M. bleueana Pitt's* var.; *Laelio-Cattleyas Dr. R. Shiffman* var. *Jane*, and *L.-C. Dr. R. Shiffman* var. *George*, *L.-C. Arras* var. *Erota*; *Dendrobium Victoria Regina*; *Sophranitis grandiflora* and others.

The Hon. G. E. VESTEX, Southport (gr. Mr. B. Collins), was also awarded a Silver Medal for a group of *Cymbidium*s in great variety.

Messrs. KEELING AND SONS, Bradford, staged *Odontioda Ceres*, *Miltonia Lyoth* and *Cirrh-petalum Collettii*.

Mr. JOHN EVANS, Colwyn Bay, staged *Brasso-Laelio-Cattleya Cowanii* var. *Evansiae*.

At the meeting on Friday, May 20, 1927, the members of Committee present were Messrs. J. B. Adamson (in the chair), R. Ashworth, A. Burns, A. Coningsby, J. Evans, Capt. W. Horridge, A. Keeling, J. Lupton, S. McLeod and H. Arthur (Secretary).

#### AWARDS OF MERIT.

*Odontoglossum Crispum Duke of Wellington*, *Cypripedium niveum Imperiale*, *Cattleya Mossiae Leviathan*, *Cymbidium Ivory Wings* (*Gottianum* × *Woodhamsianum*), and *Miltonia vexillaria Isabella*.—From J. B. ADAMSON, Esq.

*Odontoglossum Doris magnifica*; *Odontoglossum Fabia*, *Rutherford's* var.; *Odontioda Queen*

*Mary*, *Beardwood* var.—From Col. Sir. J. RUTHERFORD, Bart.

*Miltonia Warrensis* (*Sanderac* × *Hyeana*), and *M. Vespertillia* var. *splendens*.—From the Hon. G. E. VESTEY.

*Cypripedium* G. V. *Llewelyn* (G. D. *Nicholas* × *mirum*).—From G. V. LLEWELYN, Esq.

#### AWARDS OF APPRECIATION.

*Laelio-Cattleya* Robert Paterson, L.-C. G. S. Ball, *Llewelyn's* var.; *Brasso-Cattleya* Maronii, *Llewelyn's* var.; *Odontoglossum promerens*, *Llewelyn's* var. and *Brasso-Cattleya Digbyano-Mendelii* var. *Belissima*.—From G. V. LLEWELYN, Esq.

*Odontoglossum crispum xanthotes*, *Vestey's* var.—From the Hon. G. E. VESTEY.

G. V. LLEWELYN, Esq., Southport, was awarded a Silver Medal for a group of *Odontoglossums* of the *crispum* section with *O. promerens*, *Llewelyn's* var.; *Laelio-Cattleya* Robert Paterson, L.-C. G. S. Ball, *Llewelyn's* var., *Brasso-Cattleya Digbyano-Mendelii* var. *Belissima*, *Cypripedium* G. V. *Llewelyn* and others.

The Hon. G. E. VESTEY, Southport (gr. Mr. B. Collins), was also awarded a Silver Medal for a group of *Laelio-Cattleyas*, with L.-C. Canada, L.-C. *Fascinator-Mendelii*, L.-C. *Caroline* and L.-C. *Watford*; *Brasso-Cattleya* Springtide, *Odontoglossum crispum xanthotes* *Odontioda Vuylstekeae*, *Miltonia Warrensis* and others.

Col. Sir JOHN RUTHERFORD, Bart., Blackburn

#### LAW NOTE.

##### LAKES IN PLEASURE GROUNDS.

A RECENT case, *Horlick v. Scully*, referred to in *The Builder* for May 20, raised an interesting point as to the liability of a tenant for maintaining in proper condition ornamental lakes subject to the lease. In 1915, it appears, the plaintiff's predecessor in title had leased to the defendant for a term of thirteen-and-a-half years, a mansion house and grounds, together with the sporting and fishing rights, under covenants which, *inter alia*, required the tenant to keep and leave "all pleasure grounds" "in good and proper order and condition." The pleasure grounds included two ponds and three lakes, the latter occupying

FIG. 214.—MESSRS. J. CARTER AND CO.'S GOLD MEDAL EXHIBIT OF FLOWERING PLANTS AT CHELSEA SHOW.

(see p. 378).

#### CULTURAL CERTIFICATES.

To Mr. J. HOWES, for *Odontoglossum crispum* var. *Duke of Wellington*; and to Mr. J. LUPTON, for *Odontoglossum Fabia Rutherford's* variety.

#### GROUPS, etc.

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), was awarded a Gold Medal for a group of *Odontoglossums* in variety, including *O. crispum* *Duke of Wellington*, *O. eximium* *Walton Grange* var., and *O. Pescatorei alba* *Haddon House* var.; *Cypripedium niveum* *Imperiale*, *C. Annie Measures* and *C. Albion*; *Cattleya Mossiae* *Leviathan*; *Cymbidium Ivory Wings* and others.

Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), staged a group to which a Silver Gilt Medal was awarded. *Odontiodas* of the *crispum* section, *O. Wilckeanum* and *O. Eve* var. *Adam*; *Miltonia Reine Elizabeth* var. *Roi des Belges*, *M. G. D. Owen*, *M. Lucia*, *M. Rosea*, *M. Hyeana*, *M. Cobbiana*, *M. Countess of Strathmore* and *Dendrobium Victoria Regina*.

(gr. Mr. J. Lupton), staged *Odontoglossum Doris magnifica*, *O. Fabia Rutherford's* var., and *O. Pescatorei Monica*, with *Odontioda Queen Mary*, *Beardwood* var.

Messrs. KEELING AND SONS, Bradford, staged *Odontoglossum illustrissimum*, *Odontioda Zenobia*, *Cypripedium Annie Measures*, *C. Rothschildianum*; *Laelio-Cattleya* G. S. Ball and L.-C. *Lycaste cruenta*.

#### GUILDFORD AND DISTRICT GARDENERS'.

By kind permission of Sir Jeremiah Colman, about one-hundred-and-twenty members of this Association paid a visit to Gattton Park on Saturday, June 11. Gattton is famous for its Marble Hall as well as its Orchids, but it was a little too late in the season for the Orchid houses to be seen at their best. The gardens were inspected and the visit was greatly enjoyed. Mr. Collier, the gardener, joined the party at tea, and was asked to convey the thanks of the Association to his employer.

an area of about five-and-a-half acres, and it was with them, and with the trout in them, that the main ground of complaint arose. Evidence was given that when the lease was granted, although there was some mud in the lakes, they were in good and proper condition, but that two of them had since become silted up with mud so that there was not sufficient water to keep the fishing in good order and condition. In the first place, the Court held that the expression "all pleasure grounds" in the lease included the lakes, although they were not specifically mentioned. It appears to have been argued for the defendant that the clearing out of the mud would be in the nature of structural repair for which the tenant would not be liable; but the Court did not accept this contention, and held that the plaintiff was entitled to a declaration that under the covenants in the lease it was incumbent upon the defendant to keep and leave all the ornamental waters in good and proper order and condition, then proceeding to consider what was meant by "proper order and condition" in connection with the subject matter of the present case.

As regards the lakes in question, it was held that the words did not mean that the defendant must clean them out entirely, but that she must arrest any injurious element that rendered the lakes out of order, that is to say, mud must be removed in all parts where the presence of the mud reduced the depth of the water to less than two feet six inches. Dealing with the liability of the defendant on a monetary basis, the Court assessed the cost of removing the mud from the lake which was the worst of the three at £300; as regards the second lake, where the obstruction was only partial, the cost was to be estimated by surveyors and added to this sum. Damages were assessed at £20 in respect of the deterioration in the fishing. A claim as to the third lake had been given up by the plaintiff in the course of the trial, and a claim for failing to keep in repair the stone and brick curbing around the lakes was characterised by the Court as a trivial matter, no damages being therefore awarded as to this.

## Obituary.

**Thomas Richard Hayes.**—We greatly regret to learn of the death, on the 12th inst., of Mr. T. R. Hayes, the well-known landscape gardener and designer, whose firm was established about forty years ago at Keswick. Mr. Hayes retired from active business in 1924, but was aged only sixty-three at his death. A portrait of Mr. Hayes, and a short account of some of his many activities, will be found in our issue of October 4, 1924, p. 228.

**Conrad Eckert.**—We regret to record the death, which occurred on May 13, of Conrad Eckert, head gardener of the Cologne Botanic Garden. Herr Eckert, who was sixty-one years of age, went to Cologne forty years ago from Nürnberg, and was appointed gardener at the Botanic Garden in 1892. His work was in every way exemplary, and he will be greatly missed by his colleagues and friends.

**Friedrich Vaupel.**—We regret to record the death, on May 4, at the early age of fifty, of Dr. Vaupel, well-known in German horticultural circles as the President of the German Cactus Society, and Curator of the Botanical Museum at Berlin-Dahlem. Professor Vaupel fell asleep in bed while reading an abstruse scientific work, leaving the gas lamp turned on; by some mischance the gas escaped into the room, and Dr. Vaupel was found in the morning dead. The circumstance is all the more tragic, as Dr. Vaupel was looking forward eagerly to receiving the first copies of his recently written work, a *Monograph of Cacti*.

## ANSWERS TO CORRESPONDENTS.

**BLUE-FLOWERED HYDRANGEAS.**—A. W. Whilst it is claimed that iron has the effect of turning the flowers of Hydrangeas a blue colour, it is necessary to use some soluble salt of iron such as sulphate of iron and not pieces of rusty iron, such as you have tried. The sulphate of iron should be mixed with alum in solution, and applied to the roots. Ammonium alum is used by some growers for the purpose. It is applied freely twice a week. There are several proprietary articles on the market, such as Cyanol, which the makers claim will cause the flowers to be of a blue shade. In some districts the blue colour develops naturally, probably because of the nature of the soil, but it is always found that the blue tone is richer in plants growing nearer the coast, and when the flowers are not too fully exposed to the direct rays of the sun.

**EARLY VINERY.**—J. R. M. You have done well to cultivate the four varieties of Grapes you name satisfactorily in the same house; Black Hamburg and Madresfield Court are early Grapes, while the two types of

Muscats require a longer season, and generally more heat to grow them to perfection. The Vine manure mentioned is all that could be desired; the other is more suited to flowering plants; for when used for vines it results in too much growth at the expense of finish of the berries. Potash manures are of more value and should be substituted for the latter, supplemented with occasional applications of superphosphate of lime. Their use should, however, be governed by the condition of the border.

**FLOWERING TREES FOR A GARDEN.**—E. W. Suitable trees for your purpose include species of *Prunus*, *Pyrus*, *Crataegus*, *Amelanchier*, *Cercis* and *Laburnum*, also varieties of *Lilacs*. These might include 12, *Prunus Persica* flore roseo pleno (double-flowered Peach); 9, *P. Amygdalus* (Almond); 18, *P. Hisakura*; 6, *P. Sargentii*; 11, *P. Avium* flore pleno (double Gean); 14, *P. subhirtella*, *Pyrus Eleyi*; 1, *P. floribunda* var. *atrosanguinea*; 10, *P. purpurea*; 7, *P. baccata*; 20, *P. Scheideckeri*; 15, *P. spectabilis*; 19, *Crataegus Crus-galli*; 2, *C. orientalis*; 17, *C. Carrieri*; 4, *Amelanchier canadensis*; 8, *Cercis Siliquastrum*; 3, *Crataegus Oxy-cantha* flore pleno coccineo (double red Thorn); 16, *C. O. flore pleno roseo*; 5, *Laburnum alpinum*; 13, *L. Watereri*, *Lilacs Souvenir de Louis Spaeth*, *Madame Francisque Morel*, *Condorcet*, *Mont Blanc*, *Charles Joly*, and *President Grévy*. The numbers refer to the order of planting. The trees should be set twenty feet apart with *Lilac* bushes and other shrubs between.

**LYCIUM BARBARUM.**—P. E. C. The correct name of this shrub is *Lycium chinense*, the Chinese Box Thorn. It is a rapidly growing plant. The rosy-purple flowers are rather small, but are freely produced and develop attractive fruits; the egg-shaped berries, three-quarters-of-an-inch to one inch long, orange-scarlet in colour, make the bushes very ornamental in autumn. The habit of the bush tends to be wide-spreading, the rather slender branches being long and arching, thus a hedge of this plant would be very much wider than one of *Privet*, and to obtain the full beauty of the fruits it should not be closely clipped. Few shrubs are better for seaside planting than *Lycium chinense*, for it withstands gales very well, also the salt-laden air of the seaside. For the seaside it is of more value than any of the shrubs you mention, whilst it is very suitable for any part of the country.

**NAMES OF PLANTS.**—E. C. V. G. 1, *Rubus deliciosus*; 2, *Pyrus intermedia*; 3, *Diervilla Eva Rathke*; 4, *Diervilla florida*; 5, *Elaeagnus multiflorus*; 6, *Cotoneaster microphylla*; 7, *Euonymus europaeus*; 8, *Spiraea bracteata*; 9, *Arundinaria species* (if dwarf, *A. humilis*); 10, *Phyllostachys aurea*; 11, *Arundinaria japonica*; 12, *Arundinaria nitida*. X. L. 1, *Berberis vulgaris*, 2, *Euonymus latifolius*; 3, *Cytisus Dalimorei*. S. H. S. (a) *Mazus reptans*; (b) *Lamium maculatum*; (c) *Saxifraga granulata*; (d) *Geum rivale*; (e) *Trientalis europaea*. A. G. 1, *Spiraea Aitchisonii*; 2, *S. prunifolia* var. *flore pleno*; 3, missing; 4, *Rhus vernicifera*; 5, *Deutzia discolor* var. *purpureascens*; 6, *Spiraea* var. *Houttei*; 7, *Cornus alba* var. *Spaethii*; 8, *Diervilla florida* var. *H. W. H.* 1, *Crataegus Carrièrei*; 2, *C. coccinea*; 3, *Prunus japonica* var. *flore pleno*; 4, send in flower; 5, *Euonymus radicans* var. *variegatus*. G. H. *Primula Juliae*, a native of the Caucasus; your plants must have been introduced to the garden or have developed from seeds introduced by some means. W. F. *Muscari comosum monstrosum*. B. B. We cannot undertake to name varieties of garden *Pyrethrums*. Send them to some grower, such as Messrs. Kelway and Son, Langport, who specialise in these plants.—G. S. *Gloriosa Rothschildiana*.—E. S. C. *Manettia bicolor*.—H. R. S. The foliage resembles *Sparmannia africana*, but the specimen is not sufficient for correct determination.—R. E. A poor form of *Iris sibirica alba*.

**ORIGIN OF "CODLIN."**—G. L. B. The term "Codlin" is usually applied to tallish, conical, early varieties of Apples, such as *Keswick Codlin*, *Manx Codlin*, *Early Victoria* and *Lord Derby*; as a rule this type of Apple has a large, open core. According to some authorities the word "codlin" is derived from "coddle," which means to soften by boiling, and codlin Apples are those which are fit to stew or "coddle" early in the season.

**PHLOX STEMS SPLITTING.**—C. R. The Phlox stems have split and the wounds are becoming covered with callus. Splitting is probably due to resumption of growth in thickness after showers of rain following dry conditions.

**RASPBERRIES FAILING.**—G. F. G. The specimens you sent were insufficient to enable us to recognise the cause of the trouble. One or two complete canes should be sent (if necessary, cut into shorter lengths), and also the part of the root-stock from which the affected canes are growing.

**STOCKS DISEASED.**—J. A. D. The plants are attacked by Downy Mildew, *Peronospora parasitica*. This fungus is internal, hence sulphuring is not effective. It is possible that the first infection came from resting spores in the soil. If all the seedlings are badly affected it is advisable to destroy them.

**VINES UNHEALTHY.**—J. M. The vine leaves sent for examination were badly infested by mildew, red spider and thrips, and it is not surprising that the vines give unsatisfactory results. Mildew on vines is most prevalent in spring when growth is made in a fluctuating temperature, and with dryness at the roots and cold draughts. Remedies available include the dusting of flowers of sulphur on the leaves when they are damp, syringing the vines with water containing sulphur, or spraying with a solution of half-an-ounce of potassium sulphide to one gallon of water. Red spider quickly turns the leaves a rusty colour, and a severe attack soon injures the vines. A dry atmosphere and drought at the roots also favours the spread of this pest and similar remedies may be applied, as for mildew. The leaves were covered with little black thrips which increase under the same hot, dry conditions as red spider. In vineries where such plants as *Azaleas* are wintered, thrips are often troublesome. You cannot hope to save the crop this season, but much may be done by cleansing the vines when the bunches are harvested and also by thoroughly cleansing the house, vines and borders in winter. This treatment, with better cultivation, will do much to restore the vines to a more healthy condition. The *Solanum* leaves were eaten by a caterpillar.

**VINE LEAVES SPOTTED.**—T. R. Not a disease caused by fungi. The larger yellow-brown areas may be due to scorching. Red spiders were present on lower surface of leaves, and these would account for the general sickly appearance of the foliage.

**WIRE ENCLOSURES FOR FRUIT TREES.**—E. G. R. Some growers are of the opinion that wire is detrimental to the growth of fruit trees, but this would only be when the shoots were in contact with the wire, as then damage might be caused during frosty weather. The best plan is to enclose the four sides of the fruit quarter with wire netting and to cover the top when the fruits are ripening with fish netting, supported on strands of wire stretched across from posts. This would permit of throwing the whole of the top open when the fruits have been gathered to admit the sun and air to ripen the growths, and permit birds to enter and devour harmful insects that might be present. The permanent exclusion of birds from fruit plantations is a distinct disadvantage.

**Communications Received.**—C. W. M.—R. S.—W. L.—J. A. K.—R. S.—O. P. A.—G. C.—A. W. F.—E. T. E.—D. L.—G. C. J.—J. D. C.

REMARKS.—Supplies are again on the increase and prices generally are on the decrease. Carnations and Roses have been in good demand during the past week; Car-

nations of such varieties as Cupid, Pink Delight, Lady Northcliffe, Enchantress, Supreme, Aviator, Spectrum, Mrs. Hemus, Saffron and White Wonder have sold well. Of Roses the supplies of white blooms have been below requirements, such sorts as Madame Butterfly, Madame Abel Chatenay, Golden Ophelia, Roselandia, Sylvia and Richmond have been most in demand, but these may become easier in price during the present week as heavier supplies are anticipated during the next day or so. More Gaillardias, Delphiniums and Paeonies are on offer; white and mauve Sweet Sultans are now available, also Statice sinuata from home-growers, which is very fine in quality. All outdoor blooms are likely to show a considerable increase in quantity during the next week. Spanish Irises are coming to hand in good condition; Cajanus (yellow), Queen of Whites, and Wilhelmina are the finest so far received this season.

## POT PLANTS.

In this department all bedding plants have been in considerable demand during the past fortnight. All flowering plants for decorative purposes are now receiving more attention. Hydrangeas, Marguerites, Heliotropes, Campanulas, Fuchsias and Ivy-leaf Geraniums are selling freely. Some very fine Crassulas are now on offer. Supplies of rambler Roses are somewhat limited.

REMARKS.—The continuance of fine weather is reflected in the quantity of produce being handled in Covent Garden. The London "season" is responsible for the activity in the demand for choice fruits and vegetables, and business in these departments is brisk. Hothouse fruits and Strawberries, although quoted generally at comparatively high prices, are selling well. Apples from Australasia are also in good demand. Oranges are an improved business and warm weather is favourable to the sale of Lemons. Cherries from France and Italy are popular and sell freely. Apricots from Spain are mostly in a green condition and are plentiful. English Gooseberries are feeling the competition with Gooseberries from Holland. Tomatoes, after a period of firm prices, are now cheaper. Cucumbers continue to be a steady trade and are selling well. Mush-

rooms are plentiful and cheap, the warm weather favouring their development. Peas have developed rapidly and supplies are moderately heavy, but are meeting a keen inquiry. French Beans are not selling quite so freely as hitherto and are cheaper. English Asparagus is plentiful, but the competition of Peas keeps the price of Asparagus down; there is, however, a brisk enquiry for the demands of Ascot week. Salads are a slow trade and their prices low. Green vegetables are not plentiful and trade in them is only fair. New Potatoes sell fairly well and quantities are on the short side.

## GLASGOW.

A good business was done in the cut flower market at steady prices. Supplies of Irises and Gladioli continued plentiful, and the quality of double white Narcissi ensured a ready sale. White and Yellow Irises were worth from 1/- to 1/3; Imperator, 10d. to 1/2; Gladioli (Prince of Wales and Maiden's Blush), 1/3 to 1/8 (6's); Sweet Peas, 6d. to 8d. per bunch; special, 8d. to 1/6; Pyrethrus, 2/- to 6/- per dozen bunches; double white Narcissi, 4/6 to 6/-; Anemones, 3/- to 4/-; pink Carnations, 3/- to 3/6; White, 2/6 to 3/-; pink Roses, 2/6 to 3/6; red and white, 1/6 to 2/6; Lilium longiflorum (Harrisli), 2/6 to 3/- per bunch, and Gladiolus The Bride, 8d. to 10d.

Bedding plants were dearer, Geraniums making up to 10/- per dozen for Paul Crampel and Henry Jacoby; Lobelia, 3/- per box; Violas, 2/- per dozen; Antirrhinums, 1/6 per box; Marguerites, 3/- per dozen; Stocks and Asters, 6d. per dozen; and Coltness Gem Dahlias, 2/6 to 3/6 per dozen.

The fruit market was more active on increased deliveries of Strawberries, Cherries, Tomatoes, etc. Prices of English Strawberries averaged 1/6 per lb.; French Cherries, 14/- to 17/6 per "boat"; Apricots, 10/- to 11/- per crate; Cherry Plums, 9/-; Scotch Tomatoes, 10d. to 1/- per lb.; Guernsey Tomatoes, 7d. to 8d.; New Zealand Apples (Delicious, Jonathan, London Pippin and Dunn's Favourite), 17/- to 19/- per case. Sunkist Oranges, 32/- to 33/-; Valencia Oranges, 50/4s, 14/6 to 16/6; 360's, 16/- to 18/-; 300's, 19/- to 32/-; and Porto Rico Grape Fruit, 22/- to 36/-.

In the vegetable section, Cauliflowers realised 5/- per dozen; Cucumbers, 4/- to 7/-; Lettuces, 4/- per crate of 30; French Carrots, 1/-; Turnips, 1/1; and Tenerife Potatoes, 18/-.

## THE WEATHER IN MAY.

Generally dry weather continued to predominate in May, but this month (unlike during April) was largely of a spring type, the winds being mainly due easterly and north-westerly, both of these, indeed, prevailing to an unusual extent. The relative humidity was very low. The month's results for the remaining meteorological elements, however, differed little from the respective averages. The mean temperature was 52°, or not quite a degree above normal. The maximum thermometer in the screen rose to 78° on the 7th, but only passed 70° on two other days (the 8th and 9th); while a minimum of 29° on the 1st was more noteworthy, and the grass thermometer then registered 19°. In all ground frost occurred on four nights. Exactly 200 hours of bright sunshine were recorded, which aggregate is nine hours below the average. Rain fell on eleven days, or nearly three fewer than the normal number; but the total quantity was only 1.18 inch, or 1.03 inch less than the average. The ground water level fell steadily. Visibility varied a good deal being poor when the wind was easterly, and excellent when it was north-westerly. A moderate thunderstorm occurred on the afternoon of the 4th, and a slight gale (off the sea) on the evening of the 21st. Joseph Bazendell, The Fernley Observatory, Southport.

## SCHEDULES RECEIVED.

CHELTEMHAM SPA FLORAL FETE AND PROVINCIAL SHOW OF THE NATIONAL ROSE SOCIETY.—Exhibition to be held on Wednesday and Thursday, July 6 and 7. Secretary, Mr. Cyril Cassidy, 58, High Street, Cheltenham.

KINGSTON AND DISTRICT CHRYSANTHEMUM SOCIETY.—Twentieth Annual Exhibition to be held at Surbiton on Wednesday, November 9. Secretary, Mr. W. H. Divers, Westdean, Hook, near Surbiton.

PETERBOROUGH AGRICULTURAL SOCIETY.—Summer Show, to be held on July 12, 13 and 14. The Horticultural Section includes thirty-six classes of which the most important are those for a group of herbaceous flowers and foliage, in which prizes of £15, £7 10s. 0d. and £5, and the Clay Challenge Cup valued fifty guineas are offered, and for a display of Roses occupying a space of ten feet by five feet, in which the prizes are £15, £7 10s. 0d. and £5, and the Abol Challenge Trophy valued at £50. Secretary, Mr. R. Bibby, Agricultural Office, Cross Street, Peterborough.

SAFFRON WALDEN HORTICULTURAL SOCIETY.—Annual Flower and Horse Show, to be held on Thursday, July 21, 1927, in the North Deer Park, Saffron Walden. Secretary, Mr. George Collin, 66, Deben Road, Saffron Walden.

LITTLEHAMPTON HORTICULTURAL SOCIETY.—Summer Flower Show to be held on Wednesday, June 29th.—Secretary, Mr. E. Pitts Fenton, Gable Cottage, Irvine Road, Littlehampton.

ALNWICK HORTICULTURAL, ETC., SOCIETY.—Annual Exhibition, to be held on Saturday, September 3. Secretary, Mrs. G. D. Glass, Northumberland Street, Alnwick.

## CATALOGUES RECEIVED.

WATKINS AND SIMPSON, LTD., 27-9, Drury Lane, London, W.C.2.—Seeds (Wholesale).  
W. MAUGER AND SONS, Bulb Growers, Guernsey.—Bulbs.  
GEO. FOWLER LEE AND CO., LTD., Queen's Road, Reading.—Bottling outfits.

As regards the lakes in question, it was held that the words did not mean that the defendant must clean them out entirely, but that she must arrest any injurious element that rendered the lakes out of order, that is to say, mud must be removed in all parts where the presence of the mud reduced the depth of the water to less than two feet six inches. Dealing with the liability of the defendant on a monetary basis, the Court assessed the cost of removing the mud from the lake which was the worst of the three at £300; as regards the second lake, where the obstruction was only partial, the cost was to be estimated by surveyors and added to this sum. Damages were assessed at £20 in respect of the deterioration in the fishing. A claim as to the third lake had been given up by the plaintiff in the course of the trial, and a claim for failing to keep in repair the stone and brick curbing around the lakes was characterised by the Court as a trivial matter, no damages being therefore awarded as to this.

## Obituary.

**Thomas Richard Hayes.**—We greatly regret to learn of the death, on the 12th inst., of Mr. T. R. Hayes, the well-known landscape gardener and designer, whose firm was established about forty years ago at Keswick. Mr. Hayes retired from active business in 1924, but was aged only sixty-three at his death. A portrait of Mr. Hayes, and a short account of some of his many activities, will be found in our issue of October 4, 1924, p. 228.

**Conrad Eckert.**—We regret to record the death, which occurred on May 13, of Conrad Eckert, head gardener of the Cologne Botanic Garden. Herr Eckert, who was sixty-one years of age, went to Cologne forty years ago from Nürnberg, and was appointed gardener at the Botanic Garden in 1892. His work was in every way exemplary, and he will be greatly missed by his colleagues and friends.

**Friedrich Vaupel.**—We regret to record the death, on May 4, at the early age of fifty, of Dr. Vaupel, well-known in German horticultural circles as the President of the German Cactus Society, and Curator of the Botanical Museum at Berlin-Dahlem. Professor Vaupel fell asleep in bed while reading an abstruse scientific work, leaving the gas lamp turned on; by some mischance the gas escaped into the room, and Dr. Vaupel was found in the morning dead. The circumstance is all the more tragic, as Dr. Vaupel was looking forward eagerly to receiving the first copies of his recently written work, a *Monograph of Cacti*.

## ANSWERS TO CORRESPONDENTS.

**BLUE-FLOWERED HYDRANGEAS.**—A. W. Whilst it is claimed that iron has the effect of turning the flowers of Hydrangeas a blue colour, it is necessary to use some soluble salt of iron such as sulphate of iron and not pieces of rusty iron, such as you have tried. The sulphate of iron should be mixed with alum in solution, and applied to the roots. Ammonium alum is used by some growers for the purpose. It is applied freely twice a week. There are several proprietary articles on the market, such as Cyanol, which the makers claim will cause the flowers to be of a blue shade. In some districts the blue colour develops naturally, probably because of the nature of the soil, but it is always found that the blue tone is richer in plants growing nearer the coast, and when the flowers are not too fully exposed to the direct rays of the sun.

**EARLY VINERY.**—J. R. M. You have done well to cultivate the four varieties of Grapes you name satisfactorily in the same house; Black Hamburg and Madresfield Court are early Grapes, while the two types of

Muscats require a longer season, and generally more heat to grow them to perfection. The Vine manure mentioned is all that could be desired; the other is more suited to flowering plants; for when used for vines it results in too much growth at the expense of finish of the berries. Potash manures are of more value and should be substituted for the latter, supplemented with occasional applications of superphosphate of lime. Their use should, however, be governed by the condition of the border.

**FLOWERING TREES FOR A GARDEN.**—E. W. Suitable trees for your purpose include species of Prunus, Pyrus, Crataegus, Amelanchier, Cercis and Laburnum, also varieties of Lilacs. These might include 12, Prunus Persica flore roseo pleno (double-flowered Peach); 9, P. Amygdalus (Almond); 18, P. Hisakura; 6, P. Sargentii; 11, P. Avium flore pleno (double Gean); 14, P. subhirtella, Pyrus Eleyi; 1, P. floribunda var. atrosanguinea; 10, P. purpurea; 7, P. baccata; 20, P. Scheideckeri; 15, P. spectabilis; 19, Crataegus Crus-galli; 2, C. orientalis; 17, C. Carrieri; 4, Amelanchier canadensis; 8, Cercis Siliquastrum; 3, Crataegus Oxy-cantha flore pleno coccineo (double red Thorn); 16, C. O. flore pleno roseo; 5, Laburnum alpinum; 13, L., Watereri, Lilacs Souvenir de Louis Spaeth, Madame Francisque Morel, Condorcet, Mont Blanc, Charles Joly, and President Grévy. The numbers refer to the order of planting. The trees should be set twenty feet apart with Lilac bushes and other shrubs between.

**LYCIUM BARBARUM.**—P. E. C. The correct name of this shrub is *Lycium chinense*, the Chinese Box Thorn. It is a rapidly growing plant. The rosy-purple flowers are rather small, but are freely produced and develop attractive fruits; the egg-shaped berries, three-quarters-of-an-inch to one inch long, orange-scarlet in colour, make the bushes very ornamental in autumn. The habit of the bush tends to be wide-spreading, the rather slender branches being long and arching, thus a hedge of this plant would be very much wider than one of Privet, and to obtain the full beauty of the fruits it should not be closely clipped. Few shrubs are better for seaside planting than *Lycium chinense*, for it withstands gales very well, also the salt-laden air of the seaside. For the seaside it is of more value than any of the shrubs you mention, whilst it is very suitable for any part of the country.

**NAMES OF PLANTS.**—E. C. V. G. 1, *Rubus deliciosus*; 2, *Pyrus intermedia*; 3, *Diervilla Eva Rathke*; 4, *Diervilla florida*; 5, *Elaeagnus multiflorus*; 6, *Cotoneaster microphylla*; 7, *Euonymus europaeus*; 8, *Spiraea bracteata*; 9, *Arundinaria* species (if dwarf, *A. humilis*); 10, *Phyllostachys aurea*; 11, *Arundinaria japonica*; 12, *Arundinaria nitida*. X. L. 1, *Berberis vulgaris*, 2, *Euonymus latifolius*; 3, *Cytisus Dallimorei*. S. H. S. (a) *Mazus reptans*; (b) *Lamium maculatum*; (c) *Saxifraga granulata*; (d) *Geum rivale*; (e) *Trientalis europaea*. A. G. 1, *Spiraea Aitchisonii*; 2, *S. prunifolia* var. *flore pleno*; 3, missing; 4, *Rhus vernicifera*; 5, *Deutzia discolor* var. *purpurascens*; 6, *Spiraea* var. *Houttei*; 7, *Cornus alba* var. *Spathii*; 8, *Diervilla florida* var. *H. W. H.* 1, *Crataegus Carrieri*; 2, *C. coccinea*; 3, *Prunus japonica* var. *flore pleno*; 4, send in flower; 5, *Euonymus radicans* var. *variegatus*. G. H. *Primula Juliae*, a native of the Caucasus; your plants must have been introduced to the garden or have developed from seeds introduced by some means. W. F. *Muscari comosum monstrosum*. B. B. We cannot undertake to name varieties of garden Pyrethrums. Send them to some grower, such as Messrs. Kelway and Son, Langport, who specialise in these plants.—G. S. *Gloriosa Rothschildiana*.—E. S. C. *Manettia bicolor*.—H. R. S. The foliage resembles *Sparmannia africana*, but the specimen is not sufficient for correct determination.—R. E. A poor form of *Iris sibirica alba*.

**ORIGIN OF "CODLIN."**—G. L. B. The term "Codlin" is usually applied to tallish, conical, early varieties of Apples, such as Keswick Codlin, Manx Codlin, Early Victoria and Lord Derby; as a rule this type of Apple has a large, open core. According to some authorities the word "codlin" is derived from "coddle," which means to soften by boiling, and codlin Apples are those which are fit to stew or "coddle" early in the season.

**PHLOX STEMS SPLITTING.**—C. R. The Phlox stems have split and the wounds are becoming covered with callus. Splitting is probably due to resumption of growth in thickness after showers of rain following dry conditions.

**RASPBERRIES FAILING.**—G. F. G. The specimens you sent were insufficient to enable us to recognise the cause of the trouble. One or two complete canes should be sent (if necessary, cut into shorter lengths), and also the part of the root-stock from which the affected canes are growing.

**STOCKS DISEASED.**—J. A. D. The plants are attacked by Downy Mildew, *Peronospora parasitica*. This fungus is internal, hence sulphuring is not effective. It is possible that the first infection came from resting spores in the soil. If all the seedlings are badly affected it is advisable to destroy them.

**VINES UNHEALTHY.**—J. M. The vine leaves sent for examination were badly infested by mildew, red spider and thrips, and it is not surprising that the vines give unsatisfactory results. Mildew on vines is most prevalent in spring when growth is made in a fluctuating temperature, and with dryness at the roots and cold draughts. Remedies available include the dusting of flowers of sulphur on the leaves when they are damp, syringing the vines with water containing sulphur, or spraying with a solution of half-an-ounce of potassium sulphide to one gallon of water. Red spider quickly turns the leaves a rusty colour, and a severe attack soon injures the vines. A dry atmosphere and drought at the roots also favours the spread of this pest and similar remedies may be applied, as for mildew. The leaves were covered with little black thrips which increase under the same hot, dry conditions as red spider. In vineries where such plants as Azaleas are wintered, thrips are often troublesome. You cannot hope to save the crop this season, but much may be done by cleansing the vines when the bunches are harvested and also by thoroughly cleansing the house, vines and borders in winter. This treatment, with better cultivation, will do much to restore the vines to a more healthy condition. The *Solanum* leaves were eaten by a caterpillar.

**VINE LEAVES SPOTTED.**—T. R. Not a disease caused by fungi. The larger yellow-brown areas may be due to scorching. Red spiders were present on lower surface of leaves, and these would account for the general sickly appearance of the foliage.

**WIRE ENCLOSURES FOR FRUIT TREES.**—E. G. R. Some growers are of the opinion that wire is detrimental to the growth of fruit trees, but this would only be when the shoots were in contact with the wire, as then damage might be caused during frosty weather. The best plan is to enclose the four sides of the fruit quarter with wire netting and to cover the top when the fruits are ripening with fish netting, supported on strands of wire stretched across from posts. This would permit of throwing the whole of the top open when the fruits have been gathered to admit the sun and air to ripen the growths, and permit birds to enter and devour harmful insects that might be present. The permanent exclusion of birds from fruit plantations is a distinct disadvantage.

**Communications Received.**—C. W. M.—R. S.—W. L.—J. A. K.—R. S.—O. P. A.—G. C.—A. W. P.—E. T. E.—D. L.—G. C. J.—J. D. C.

REMARKS.—Supplies are again on the increase and prices generally are on the decrease. Carnations and Roses have been in good demand during the past week; Car-

nations of such varieties as Cupid, Pink Delight, Lady Northcliffe, Enchantress, Supreme, Aviator, Spectrum, Mrs. Hemus, Saffron and White Wonder have sold well. Of Roses the supplies of white blooms have been below requirements, such sorts as Madame Butterfly, Madame Abel Chatenay, Golden Ophelia, Roselandia, Sylvia and Richmond have been most in demand, but these may become easier in price during the present week as heavier supplies are anticipated during the next day or so. More Gallardias, Delphiniums and Paeonies are on offer; white and mauve Sweet Sultans are now available, also Statice sinuata from home-growers, which is very fine in quality. All outdoor blooms are likely to show a considerable increase in quantity during the next week. Spanish Irises are coming to hand in good condition; Cajanus (yellow), Queen of Whites, and Wilhelmina are the finest so far received this season.

## POT PLANTS.

In this department all bedding plants have been in considerable demand during the past fortnight. All flowering plants for decorative purposes are now receiving more attention. Hydrangeas, Marguerites, Heliotropes, Campanulas, Fuchsias and Ivy-leaf Geraniums are selling freely. Some very fine Crassulacae are now on offer. Supplies of rambler Roses are somewhat limited.

REMARKS.—The continuance of fine weather is reflected in the quantity of produce being handled in Covent Garden. The London "season" is responsible for the activity in the demand for choice fruits and vegetables, and business in these departments is brisk. Hothouse fruits and Strawberries, although quoted generally at comparatively high prices, are selling well. Apples from Australasia are also in good demand. Oranges are an improved business and warm weather is favourable to the sale of Lemons. Cherries from France and Italy are popular and sell freely. Apricots from Spain are mostly in a green condition and are plentiful. English Gooseberries are feeling the competition with Gooseberries from Holland. Tomatoes, after a period of firm prices, are now cheaper. Cucumbers continue to be a steady trade and are selling well. Mush-

rooms are plentiful and cheap, the warm weather favouring their development. Peas have developed rapidly and supplies are moderately heavy, but are meeting a keen inquiry. French Beans are not selling quite so freely as hitherto and are cheaper. English Asparagus is plentiful, but the competition of Peas keeps the price of Asparagus down; there is, however, a brisk enquiry for the demands of Ascot week. Salads are a slow trade and their prices low. Green vegetables are not plentiful and trade in them is only fair. New Potatoes sell fairly well and quantities are on the short side.

## GLASGOW.

A good business was done in the cut flower market at steady prices. Supplies of Irises and Gladioli continued plentiful, and the quality of double white Narcissus ensured a ready sale. White and Yellow Irises were worth from 1/- to 1/3; Imperator, 10d. to 1/2; Gladioli (Prince of Wales and Maiden's Blush), 1/3 to 1/8 (6s); Sweet Peas, 6d. to 8d. per bunch; special, 8d. to 1/6; Pyrethrus, 2/- to 6/- per dozen bunches; double white Narcissus, 4/6 to 6/-; Anemones, 3/- to 4/-; pink Carnations, 3/- to 3/6; White, 2/6 to 3/-; pink Roses, 2/6 to 3/6; red and white, 1/6 to 2/6; Lillium longiflorum (Harrisii), 2/6 to 3/- per bunch, and Gladiolus The Bride, 8d. to 10d.

Bedding plants were dearer, Geraniums making up to 10/- per dozen for Paul Crampel and Henry Jacoby; Lobelia, 3/- per box; Violas, 2/- per dozen; Antirrhinums, 1/6 per box; Marguerites, 3/- per dozen; Stocks and Asters, 6d. per dozen; and Coltness Gem Dahlias, 2/6 to 3/6 per dozen.

## THE WEATHER IN MAY.

Generally dry weather continued to predominate in May, but this month (unlike during April) was largely of a spring type, the winds being mainly due easterly and north-westerly, both of these, indeed, prevailing to an unusual extent. The relative humidity was very low. The month's results for the remaining meteorological elements, however, differed little from the respective averages. The mean temperature was 52°, or not quite a degree above normal. The maximum thermometer in the screen rose to 78° on the 7th, but only passed 70° on two other days (the 8th and 9th); while a minimum of 29° on the 1st was more noteworthy, and the grass thermometer then registered 19°. In all ground frost occurred on four nights. Exactly 200 hours of bright sunshine were recorded, which aggregate is nine hours below the average. Rain fell on eleven days, or nearly three fewer than the normal number; but the total quantity was only 1.18 inch, or 1.03 inch less than the average. The ground water level fell steadily. Visibility varied a good deal being poor when the wind was easterly, and excellent when it was north-westerly. A moderate thunderstorm occurred on the afternoon of the 4th, and a slight gale (off the sea) on the evening of the 21st. Joseph Bazendell, The Fernley Observatory, Southport.

# FOSTER & PEARSON, LIMITED, BEESTON, NOTTS.

Have been building Greenhouses from 1841 to  
1927, a record of 86 years of sound construction.

**GOOD Greenhouses last—others do not.**

**The ROBIN HOOD BOILER**  
reduces the fuel bill and saves labour.

Estimates on application Free.

**W. Duncan Tucker & Sons Ltd.**  
ESTABLISHED 1830  
TOTTENHAM N15

will promptly and skilfully—  
repair your Glass House

**C**omes a time when your Glass House  
may show signs of wear. A rotting, or  
maybe warping, of the wood; a blister-  
ing of the paint; general insecurity and  
shoddiness. Carpenters, Glaziers, and 'Odd-  
job' men, each have their uses. But this is  
specialists' work—work for William Duncan  
Tucker & Sons Ltd.—builders and repairers  
of Glass Houses since the reign of George

the Fourth. They will repair the damage  
with promptitude and efficiency at a reason-  
able cost, lavishing all their experience and  
technical skill on it. Why not call in their  
aid for your repair work? Or better still  
instruct them to build you a Glass House.  
No need for repairs then. A Duncan Tucker  
structure is a joy to the eye and an asset to  
any garden.

## "ROOT & STEM VEGETABLES"

*By the late Alex. Dean, V.M.H.*

**PRICE 3/- Post Free.**

**ONE** of the famous "Present-Day Gardening" series, edited by the late R. Hooper Pearson, containing eight lovely coloured plates. Only a few of these books now remain, and they are not being reprinted, so that the opportunity of securing one may not be available much longer.

**GARDENERS' CHRONICLE, LTD.**  
5, Tavistock Street, Covent Garden, W.C. 2

# FERNS AND FERN CULTURE

By **J. BIRKENHEAD.**

Revised by **F. Parsons.**

**PRICE 1/4 POST FREE**

Ferns ought to play a much larger rôle than they do in the English garden. There are so many places where, in consequence of shade cast by tall trees or high walls, flowers needing sunshine will not thrive, and where Ferns, on the contrary, would luxuriate, given only sufficient moisture.

Ferns have a grace and dignity all their own, and can redeem by their beauty what would otherwise be a bare and unattractive corner of the garden. Those wishing to cultivate them cannot do better than purchase the little book whose title appears above.

*It can be obtained from :*

**THE GARDENERS' CHRONICLE LTD., 5, TAVISTOCK STREET, LONDON, W.C.2.**

## You Decide

Hoeing and Hand-picking are back-aching jobs and unsatisfactory in the end. Do your weeding scientifically with WEEDICIDE which does the job thoroughly by destroying the roots.

Weedicide is a powerful Arsenical preparation, and is highly commended by the Royal Horticultural Society.

**NOTE ITS HIGH CONCENTRATION** — 1 gallon (9/-) dilutes to 100 gallons water and is sufficient to treat 300/400 square yards at the low cost of 1d. per gallon.

Pint 1/9, quart 3/-, ½ gallon 5/-, 1 gallon 9/-, 2 gallons 17/-, 5 gallons 36/6, 20 gallons 105/-, 40 gallons 200/-

## Gas Storage of Fruit.

THE Food Storage Board of the Department of Scientific and Industrial Research has issued a specially valuable *Report*.\* It is one which deserves to be studied as attentively by home growers of fruits as it will be by growers overseas who look to our markets for the disposal of their produce. As the *Report* states, chilling as a means of preventing the perishing of fruits has probably reached its limit of application, for it permits of the transport of fruits and vegetables only within a limited radius. For this reason other methods of extending the storage life of fruits and vegetables are being investigated. Where the conservation of the intact fruits is not necessary, the freezing method is probably the most economical, for although, of course, frozen fruit when thawed is reduced more or less to pulp, the quality is not impaired. Hence the jam maker and the confectioner find in this method a useful means of preserving otherwise perishable material. But if the living state of fruit is to be preserved, other means must be employed. For this reason the Research Staff of the Food Board has devoted its attention to the study of the behaviour of fruits under various conditions of gas storage. The scientific

considerations which encourage the belief that storage might be effected in this way are very simple. Oxygen is essential to the life of plants. Carbon dioxide in small doses stimulates vital activity; in larger doses depresses it, and in yet larger amounts acts as a poison. Living fruits, like the other parts of plants, use oxygen and evolve carbon dioxide, and hence in a sealed vessel containing living fruit oxygen disappears and is replaced by carbon dioxide—the increase of carbon dioxide being approximately equal to the decrease of oxygen. Ventilation, that is, the introduction of fresh air, provides a means of regulating the composition. The ventilation may be of the ordinary kind, that is, the admission of fresh air with its twenty-one per cent. of oxygen, and its low, 0.04, per cent. of carbon dioxide; or it may be "negative," that is, carbon dioxide may be introduced. Thus it is possible to maintain an approximately constant atmosphere in the container in which fruit is stored. In the early experiments carried out in 1918 and subsequent years it was shown that ripening may be retarded without ill-effects to the fruits by reducing the amount of oxygen in the air, and it was found that an increase of carbon dioxide also retards ripening. As an example of the results obtained, the case of Apple Stirling Castle may be cited. This Apple turns yellow after twenty-eight days in air, but is still green after 114 days in an atmosphere containing 5-10 per cent. of oxygen and 10-15 per cent. of carbon dioxide. The artificial gas storage also delays the softening of the fruits and the formation of sugar in them. Large scale experiments confirmed the results of laboratory tests. A gas store was constructed at Histon on the property of Mr. John Chivers, who has taken the keenest interests in these experiments, and the experiments included the testing of the gas storage system against various other well-known methods of storage. The experiments revealed both the potential merits of gas storage and serious difficulties of its application—the chief of which lay in the fact that it is technically a very difficult matter to prevent a large cement container from exhibiting air leaks. When this difficulty was overcome it was shown that by the gas storage method the life of Apples (Bramley's Seedling) was more than double that under ordinary conditions of storage. Another difficulty which has to be overcome consists in preventing change of temperature by the self-heating of the fruits. In the course of experiments on this subject it was found that gas storage with 10 per cent. of carbon dioxide is most effective at temperatures at about 50°F. Humidity also should be controlled, but in practice this is by no means easy. The experiments, which are to be continued, are manifestly fraught with great possibilities not only for the foreign grower but also for the home producer. That they will lead to important developments in the practice of fruit storage is certain, and therefore the results of the further experiments will be awaited with interest by all those concerned with the growing or marketing of fruits.

**International Horticultural Conference at Geneva.**—About one hundred delegates attended at the Conference of the Fédération Horticole Professionnelle Internationale at Geneva on Monday, June 20, when M. Rochaix, President of Agriculture for the Canton of Geneva, opened the proceedings with a speech of welcome on behalf of the Swiss Government and the city of Geneva. M. J. Vachoux, President of the Association of Swiss Horticulturists, who

presided over the Conference, also offered a welcome to the foreign delegates. The Conference commenced at 8.30 a.m., an hour considered early by the British delegates who, however, turned up well to time, those representing the old country being Messrs. H. T. Mason, President of the British Florists' Federation; Mr. E. Laxton, past President of the Horticultural Trades' Association; Mr. C. Du Cann, Mr. C. Engelmann, Mr. W. E. Wallace, Mr. C. H. Curtis, Mr. J. Godber, Mr. Rich, Mr. J. S. Brunton and Mr. G. D. Clark, the last-named acting as interpreter for the British delegation. Mrs. Wallace, Mrs. Laxton and Mrs. Curtis were also present at the opening proceedings. By twelve o'clock a very considerable part of the programme was finished, when an adjournment was made for lunch, given by the State Council of the Canton of Geneva, in the beautiful park des Eaux-Vives—recently presented to the city—overlooking the Lake of Geneva. The Conference was continued at 4 o'clock, after several minor Committees had met, and the accounts for the past year had been audited. The chief business of the morning was the consideration of the minutes of the previous Conference, the consideration of international charges for the transport of horticultural goods, the question of protection under the guise of prohibition for the purpose of excluding pests, the condition of horticulture in the countries represented at the Conference, and the subject of co-ordinating pathological services. A report of the proceedings will appear in our next issue.

**The Jones-Bateman Cup.**—In 1920, Miss L. Jones-Bateman, of Cae Glass, Abergelle, presented to the Royal Horticultural Society a valuable Silver-gilt replica of the Warwick Vase, to be used for the encouragement of fruit production. It is offered triennially for researches in the growing of hardy fruits, Figs, Grapes and Peaches in the open or under glass, and is available for award in 1927. Candidates should submit accounts of their work by October 31. The work dealt with must have been carried out by the candidate in the United Kingdom, mainly during the past five years. The Cup will be held for three years by the successful candidate, who must give a bond for its safe return, and when the Cup is relinquished the holder will receive a commemorative gold medal. The holder will be eligible to compete on the next or any succeeding occasion. The assessors will be three, two appointed by the Royal Horticultural Society and one by the National Farmers' Union, and they will report to the Council of the Royal Horticultural Society upon the originality and comparative potential value to the fruit-growing industry of the work of the candidates. The Council of the Royal Horticultural Society will award or withhold the Cup at its discretion.

**The National Memorial to Queen Alexandra (Garden Scheme).**—Major A. Dorrien-Smith, of Tresco Abbey, Isles of Scilly, in addition to opening his gardens to the public from July 25 to August 6 on behalf of the Queen Alexandra Memorial Fund, has kindly agreed to allow visitors to enter from July 10 to 20, when *Metrosideros tomentosa*, named "Pohantakawa" by the Maoris, will be in flower. There are frequent trains from Paddington to Penzance, and an excellent steamship service from there to the Scilly Isles. Further particulars may be had from the National Memorial to Queen Alexandra, 28, Windsor House, Victoria Street, S.W.1.

**Prohibition of Imports of Cherries from France.**

—In view of the discovery of consignments of French Cherries heavily infested with the larvae of the Cherry Fruit Fly, the Ministry of Agriculture has made an Order prohibiting the landing in England and Wales of raw Cherries grown in France. The Order came into force on the 24th inst., and operates for the remainder of the season.

**Dahlias at Southport.**—The Flower Show Committee and the Parks Committee of the Southport Corporation have arranged, in conjunction with the National Dahlia Society, for the growing in a border in the South Marine Park adjoining Southport Promenade, of a representative

\*Food Investigation. Special Report No. 30. "Gas Storage of Fruit." Department of Science and Industrial Research, H.M. Stationery Office, 1927, price 1s. 9d. net.

collection of the best varieties of Dahlias in the various sections. The following types of the flower will be represented: Cactus, large Paeony, large Decorative, Collette, Pompon, Star, Show or Fancy, Single and Mignon; in all there will be about 730 plants. For the purpose of comparison, plants of several species of Dahlia will be included, these having been kindly sent by Mr. T. Hay, Superintendent of Hyde Park, London, at the request of the National Dahlia Society; the other plants are being supplied by firms who specialise in the Dahlia. This special border of Dahlias is intended to be of an educational character, and as the different sections of the plants will be labelled, it is anticipated that the public will derive much practical knowledge of the habit and growth of the different varieties by inspecting the plants when they are in bloom. It is expected that most of the Dahlias will be in flower during the period of the Southport Flower Show on August 24, 25 and 26. The border is nearly opposite Scarisbrick Avenue, and situate near to the Bowls House, facing the Promenade.

**The National Sweet Pea Society.**—We would remind our readers that entries for the annual show of this Society, which is to be held at the R.H.S. Hall, Westminster, on July 7 and 8, next, must reach the Secretary, 19, Bedford Chambers, Covent Garden, W.C.2, not later than June 29.

**Linnean Society's Awards.**—At the anniversary meeting of the Linnean Society, the President Dr. A. B. Rendle, presented the Crisp Award and Medal to Prof. H. Graham Cannon, of Sheffield University, and the Linnean Gold Medal to Dr. Otto Stapf, formerly Keeper of the Herbarium, Royal Botanic Gardens, Kew. At the same meeting, Sir Sidney Frederic Harmer, K.B.E., F.R.S., was appointed President; Mr. H. W. Monckton, Treasurer; Dr. W. T. Calman, Zoological Secretary, and Mr. John Ramsbottom, Botanical Secretary.

**Ayrshire Potato Sales.**—The first of the series of auction sales of early Potato crops in the Girvan and Maybole districts of South Ayrshire began on Tuesday, the 14th inst., and were continued during the remainder of the week. In consequence of the late frosts experienced in May and the dry weather of June, the crops are in a backward condition, and as the quality and weight of the tubers varied, prices fluctuated to a wider extent than is usual. On a few farms a number of lots were withdrawn from sale as the result of the frost, but there was spirited competition for the choice lots which had escaped injury. The high price of £64 per acre was realised for a small crop of nine acres on the farm of Burnside, but the individual farm average ranged from £28 to £55 per acre. One transaction was recorded at £20 per acre, a low figure that has not been equalled since pre-war days. Epicure is the variety exclusively grown and digging operations have already commenced.

**Sale of Stamperland Estate.**—Mr. Robert Paterson, who has purchased a residence in Sussex, has sold his estate near Clarkston in Renfrewshire, together with the range of glasshouses in which the Stamperland collection of Orchids was accommodated, to Mr. James Wright, builder, Glasgow, who purposes developing the land extending to 110 acres on the lines of a garden city.

**Mr. J. Wilson.**—The many friends of Mr. J. Wilson, Superintendent of the Fruit and Vegetable Department, Wisley, will be interested to know that he has been appointed gardener to Sir Philip Sassoon, Trent Park, New Barnet, and is taking up his new duties early in July. Mr. Wilson has been at Wisley for the past sixteen years and has been successively journeyman, propagator and superintendent of the Fruit and Vegetable Department.

**Window Garden Competition in Vienna.**—The Municipality of Vienna is organising a competition, in which valuable money prizes are to be offered for the best window balcony, business premises, and dwelling house decoration. Information is given freely by the municipal authorities as to the best flowers

and plants to use for this kind of planting, and the competition should have a very valuable educative effect.

**Mr. Thomas Wells.**—The popular Park Superintendent of Barnsley, Yorkshire, is a Lancashire man who commenced his career in the gardens of W. F. Fitzherbert Brookholes, Esq., Cloughton Hall, Garstang. He proceeded into Messrs. Dickson's nurseries, Chester, and after serving there for a period he went as journeyman at The Pastures, Derby, and subsequently became foreman at Burwarton Hall, Shropshire. Later, he went to Trentham Hall and served for two years under Mr. Peter Blair, leaving Trentham to take charge of the gardens at Barlaston Hall, Staffordshire. He occupied similar positions at Highfield Hall, Leek and at Wooley Park, Wakefield, where he remained for sixteen years. In 1917, Mr. Wells was appointed Superintendent of the Public Parks at Barnsley, and since entering upon municipal work he has made Locke Park, Barnsley, one of the most

MR. THOMAS WELLS.

noted places in south Yorkshire. Although situated in the midst of the coal mining industry, Mr. Wells has been able to produce floral displays, both outside and under glass, which would do credit to anyone placed under much more favourable climatic conditions. Locke Park possesses a good up-to-date range of glass, including large show houses, and during the year Mr. Wells provides a fine rotation of displays, the chief of which are Cinerarias, Calceolarias, Hippeastrums, Schizanthuses and Chrysanthemums. The summer glory of this park is what is known as the "Quarry Gardens," constructed from a disused quarry it has been converted into a paradise of flowers, and with the slopes on both sides planted with trees and shrubs, with a winding path through the centre, a broad stretch of grass set with beds, and a broad border on both sides running the whole length of the valley, it lends itself to the making of a fine flower garden which is at its best during August and September. Mr. Wells finds that the plants which give the best results for bedding in the midst of the colliery districts such as Barnsley, are Dahlias, Antirrhinums, Pelargoniums, Heliotropes, Fuchsias, Centaureas, Calceolarias and Begonias. Last year, Mr. Wells introduced—as a new feature in Barnsley—carpet bedding into some of the small beds, using various varieties of Alternantheras, Arenarias, Echeverias, etc., while at the entrances to the park, where there is a long, narrow border at the base of a Laurel bank, the admonition to "Enjoy the Beauties of Nature," was worked out in carpet bedding. The Barnsley Corporation caters on a large scale for sports,

and the bowling greens and tennis courts are some of the finest in the country. Mr. Wells is very popular both with the people of Barnsley and the gardeners of the district.

**A New International Dictionary of Agriculture.**—Further progress has, we understand, been made with the preparation of the *International Agricultural Dictionary* mentioned by us in our issue of October 3, 1925 (p. 261), which is being published by the International Institute of Agriculture in Rome. We have received a specimen of the first fascicle of sixteen pages, which runs from Abaca to Accaparement (the alphabetical classification being in French). The explanatory text is in French and English, the words classified being also translated into twenty-three other languages in so far as the equivalents exist. The general principle on which the scheme of the *Dictionary* is based is that of the collection of the most important terms used by technicians and specialists in agriculture, agricultural industries, and allied sciences. The work is to be published in monthly parts consisting of thirty-two large octavo pages in double columns, with a cover, the whole to be completed in about ninety parts; in addition, there will be an index of the words in all the languages used.

#### Economic Botanist's Visit to the West Indies.

We learn that Mr. H. C. Sampson, who was recently appointed Economic Botanist at the Royal Botanic Gardens, Kew, left this country on the 11th inst. for British Guiana at the invitation of the Governor and under the auspices of the Colonial Office and the Empire Marketing Board, to study and report on various agricultural matters in the colony. He will also visit Trinidad and the Imperial College of Tropical Agriculture, and Barbados.

**Echium callithyrum.**—The magnificent plant of *Echium callithyrum* illustrated in Fig. 215, is growing in the gardens of Mr. A. F. Calvert, at Coverack, Cornwall, who kindly forwarded us the photograph. Mr. Calvert informs us that the plant developed this season 320 of the large, cobalt-blue inflorescences, and that it measures twenty-one feet across and six feet in height. The species is a native of the Canary Islands, and requires a mild climate, such as that of Cornwall or the Scilly Isles, from which latter place the cutting was obtained originally by Mr. Calvert. *E. callithyrum* is sometimes known in gardens as *E. arboreum*, and is the largest and handsomest of all the giant Buglosses which are found in the Canary Islands. The flower spikes measure about a foot in length, and are about three inches wide.

#### Appointments for the Ensuing Week.

MONDAY, JUNE 27: Romsey and District Gardeners' Association's outing. TUESDAY, JUNE 28: Royal Horticultural Society's Amateur show. WEDNESDAY, JUNE 29: Royal Norfolk Agricultural Association's show (two days); Yorkshire Flower Show and Gala (three days); Littlehampton Horticultural Society's show. THURSDAY, JUNE 30: Newport (Mon.) Horticultural Society's Rose Show in aid of the Royal Gwent Hospital; Paisley Florists' Society's meeting. FRIDAY, JULY 1: National Rose Society's show (two days); Accrington and District Chrysanthemum Society's meeting. SATURDAY, JULY 2: Blackburn and District Horticultural Society's meeting.

#### "Gardeners' Chronicle" Seventy-five Years Ago.

**Watering with Gutta Percha Tubing.**—Farmers, gardeners, florists, and all who have a garden, will save a deal of trouble in watering and manuring gardens or land by using Gutta Percha tubing. Testimonials to its efficiency, economy, durability and convenience, are being constantly received. Half-inch bore tubing, for gardening, 3d. light, 3½d. medium, and 4d. per foot stout, which is the best and more flexible. Copper branch, stopcocks, and rose complete, 4s. 6d., 5s. 6d., 6s. 6d. and 10s. 6d. each. Brass or Gutta Percha unions and unions and stopcocks, to attach to cisterns or butts, all sizes. Price list sent on application to James Sheath and Company, at the Patent Gutta Percha and India Rubber Warehouse, 35, Old Street Road, London. Advertisement in Gard. Chron., June 26, 1852.

## INDOOR PLANTS.

## RICHARDIA ELLIOTTIANA.

THE golden Arum is one of the very best plants for furnishing the stages in the greenhouse or conservatory during the early summer. The flowers remain in good condition for a fortnight or more, and also last exceedingly well when cut and placed in water.

The spathe is rich yellow in colour, fading with age to a greenish tint; the leaves are similar in shape and size to those of the more common *Richardia africana* (syn. *R. aethiopica*), but are marked with a few white or translucent spots, while the leaf petioles are also more or less blotched.

## HARDY FLOWER BORDER.

## GARDEN LUPINS.

THE value of the modern Lupin as a border plant is generally recognised, and it occupies an important position amongst early summer flowering plants in most gardens. It is, however, when planted on a large scale, that really imposing floral spectacles are produced, and the *Polyphyllus* hybrids are essentially adapted to this purpose.

The ease of propagation, quickness of growth and abundance of flowers make this plant an invaluable subject for the production of quick effects where a large area is in course of development. The Lupin adapts itself readily to almost any soil, and is particularly valuable on com-

linear leaves which are glabrous and of a rich green colour. Above the foliage arise red-tinted stems three or more inches high bearing one or two pairs of leaves and terminated by clusters of from three to six short pedicelled blooms rising from clusters of small, tooth-like bracts.

The flowers are about half-an-inch in diameter; the corolla is of a rich rose-pink, while the calyces are tinted with red and covered with soft, silky down.

The plant flowers freely during June and July; it should be planted in a sunny position in the moraine or a cliff crevice. A. G. F.

## SILENE HOOKERI.

THIS lovely species, one of the gems of the race, is a native of Oregon and California,

FIG. 215.—ECHIUM CALLITHYRSUM. (see p. 444.)

The tuber is somewhat similar in appearance to that of a *Caladium*, and is very floriferous.

Unlike the white-flowered *Richardias* the growth of *R. Elliottiana* is deciduous, and after a period of rest, the corms should be potted early in February, using a rich, fibrous compost containing a little dried cow-manure. The pots should be just sufficiently large to accommodate the corm, which should be started in a house having an intermediate temperature. Great care must be exercised in watering at this period, but when the pots are filled with roots liberal supplies of moisture will be necessary.

The plant is a strong grower and a gross feeder, therefore generous treatment is necessary to obtain good specimens. When well cultivated a second crop of flowers is obtained. Shift the plants into larger pots as they require more root room and feed the roots occasionally with weak liquid manure made from sheep dung. During its period of growth, *R. Elliottiana* requires a higher temperature than *R. africana*, and a humid atmosphere.

During the summer the plants may be grown in a cold house or cold frame. From the beginning of October the supply of moisture supplied to the roots should be reduced, and during the winter only just sufficient to keep the soil from becoming dust-dry is necessary. T. H. Everett.

paratively poor soils, where the plants may even be used to improve the ground for future planting. They are surprisingly free from the attacks of pests and diseases, and even when the main spike of flowers has passed, the lateral spikes continue to give colour and considerably lengthen the flowering period.

Whereas the range of colour in the old-time Lupins was almost confined to shades of blue and white, that of the more recent introductions has very much widened and includes every shade of pink from the most delicate flesh to the deepest rose, yellows from the palest cream to deep apricot, a number of lavenders, mauves and purples, and many attractive combinations of these colours. The newer varieties retain all the good qualities of the older ones, and thus offer exceptionally fine material for the creation of massive colour effects of great diversity. A. P. C.

## ALPINE GARDEN.

## SAPONARIA CAESPITOSA.

THIS is an attractive little alpine from the Pyrenees, where it is to be found on limestone rocks forming close mats of sharply pointed,

and though introduced to this country so long ago as 1873, is still only to be obtained as a rare novelty.

Of loose, spreading habit, it produces a quantity of trailing, angular growths about nine inches in length, arising from a stout, central tap-root. These growths are sparsely furnished with oppositely disposed, narrowly elliptic leaves which taper into long, slender pedicels; they have entire margins and are clothed on both surfaces with silky down. Because of the downy character of the plant it is advisable to protect it from excessive overhead moisture in winter by means of a sheet of glass.

The flowers in most instances are produced singly and plentifully, if the plant is happily situated, during late June and July. They are two inches or more across, the large, soft, pink petals being deeply divided into four narrow lobes, which, combined with the white, tooth-like structures at the base of the blade, impart to the flowers a dainty, feathered appearance.

This *Silene* is worthy of a choice position in the rock garden, where it should be planted in full sunshine and in deep, light soil. Damp in winter seems to be chiefly responsible for its failure, which misfortune should be guarded against by raising fresh stock from seeds, which are sometimes produced abundantly. A. G. F., Wisley.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Odontoglossum citreolum.**—This Orchid also requires attention so soon as the flower-scapes are removed. The latter are produced simultaneously with the new pseudo-bulbs, in perfectly pendulous racemes, hence the desirability of growing the plants in pans or baskets, which can be suspended from the roof rafters. When the plants are well-rooted and in full growth, an abundant supply of moisture should be given to the roots. So soon as growth is completed, this Orchid needs a long rest, by keeping it dry and exposing it to as much light as possible to ensure the ripening and consolidating of the newly-made growths.

**Cattleya Lueddemanniana (speciosissima).**—This Orchid and its numerous varieties, both white and coloured, delight in the temperature of the warm Cattleya house. Many have some difficulty in flowering the plant, through, in some cases, growing it in too cool conditions, too far from the light, and disturbing it at the roots at the wrong season. To keep Cattleyas and their allies in good health they should have new rooting material whenever they require it; the compost should be of a clean, porous nature. The drainage material should be ample to allow water to pass away readily. A sweet, humid atmosphere should be maintained whilst the plants are making their growth, and a drier atmosphere whilst they are at rest, but not excessively dry even at that season.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERLEY, Horsley Hall, Greatford, N. Wales.

**Runner and Dwarf Beans.**—Further sowings of both Runner and Dwarf Beans may be made, and the plants treated as advised in a previous calendar. If the soil is very dry, it should be well watered before sowing the seeds; the latter may be soaked for a very short time to hasten their germination. If not already done, place supports to those sown or planted earlier.

**Cucumbers.**—Where these are cropping, either in houses or frames, care should be taken to train the shoots, so that crowding the growths is prevented. Keep the laterals pinched at the joint beyond the fruit. Remove all badly-shaped and misplaced fruits, also a few others, if the crop is in excess. Cucumbers at this stage require an abundance of moisture at the roots, and manurial assistance should be afforded them about twice weekly. Top-dress the roots when required with a rich compost consisting of good loam and horse droppings, with a little bone-meal and soot added. Use the syringe freely, or red spider will spread quickly. Should thrips be troublesome, vaporise the house so soon as they are detected.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Orchards.**—Trees bearing good crops will be benefited by a liberal soaking at the roots with liquid manure, and especially if they are growing in grass land; keep the grass very short for several feet around each tree, as there is nothing more harmful to the welfare of orchard trees than letting the grass grow to be turned into hay. This I have repeatedly observed; on the contrary, where the grass had been kept very short by sheep grazing it and the roots of the trees well manured, vigour was maintained and the fruits grew to a good size and developed high colour and quality. I. American blight is present on the trees dress the latter frequently with strong paraffin emulsion or Katakilla. The former specific

should be applied to the affected parts with a brush; the other syringed thoroughly on all parts, according to directions issued by the makers.

**Raspberries.**—If not done already, remove all young canes that are not required for fruiting next year or for increase of stock. Thin the canes to an average distance of about eight inches apart, according to the health and strength of the growths, and secure them to the wires as they advance in size. There is a good prospect for a satisfactory crop of berries, but the roots need a thorough soaking of water to favour the swelling of the fruits and to strengthen the young canes. Both mulching the rows with manure and thoroughly soaking the roots with liquid stimulants will prove very beneficial to the crop and should not be neglected in dry weather.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Figs.**—The fruits of the second crop on early forced Fig trees are swelling, and the crop should be thinned, retaining the most forward fruits that will ripen quickly. This end is best secured by rubbing off most of the small fruits as they develop, except those late enough to pass through the winter and furnish the first crop next year. Very early trees may be induced to ripen a third crop, but the fruits will be small, and owing to the length of time they would take to ripen the trees would have no time for rest. Assuming that the roots were kept slightly drier when the first Figs were ripening, the roots should now be fed liberally with warm, diluted liquid manure, in addition to rich top-dressings. The trees should be syringed liberally, and if red spider has attacked the trees, now is the time to eradicate the pest by maintaining a thoroughly moist atmosphere, which is no difficult matter, as sun heat will now permit of closing the house early with a temperature ranging 80° to 90°.

**Red Spider on Vines.**—Nothing prevents Grapes from colouring perfectly more than an infestation of red spider on the foliage. No matter how perfect the condition of the Vines may be, if red spider spreads on the leaves before the berries commence to colour, the finish of the berries will be impaired, and means should be taken at once to eradicate the pest. Muscat of Alexandria and Black Hamburg Grapes are, perhaps, more susceptible to this pest than other varieties owing to the fact that they need more fire-heat. Syringing or sponging the leaves at this stage is a most difficult operation without spoiling the appearance of the bunches. This pest generally starts first in dry corners of theinery, and one of the best of all remedies is to dust the affected leaves with dry sulphur on its first appearance. By using a distributor the foliage may be covered with the sulphur quickly without disfiguring the bunches.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brockett Hall, Hertfordshire.

**Stephanotis floribunda.**—This beautiful stove or intermediate house climber will probably have passed its first blooming stage, and will be making a considerable amount of growth. The work of thinning and regulating the growths should be given early attention. The Stephanotis is generally trained on wires near the roof-glass of a stove, although two crops of flowers may be obtained from plants growing in an intermediate house by timely attention given to the thinning of the shoots. This climbing plant enjoys plenty of atmospheric moisture during the growing season, and where the roots are growing under restricted conditions (which I prefer) the plants will require liberal supplies of manure water. This climber may be easily propagated from cuttings by taking off young shoots with a heel and inserting them in a sandy compost in a moist propagating frame. A suitable compost for this plant consists of good fibrous loam and peat with broken charcoal and coarse sand added to ensure free drainage.

### THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic  
Gardens, Kew.

**Roses.**—Varieties of Roses which succeed on their own roots may be successfully propagated indoors at this time. Shoots that have finished flowering are suitable for use as cuttings, and they are best taken off with a heel, selecting medium-sized growths with firm wood for the purpose. The cuttings should be about four inches long. They may be inserted in pots of sandy soil, and stood in a close propagating case in specially prepared beds in a propagating house, or they may be dibbled in beds made over a mild hot-bed of manure and leaves in cold frames. Although most varieties of garden Roses may be rooted from cuttings, not all of them will grow successfully. This, I find, is determined entirely by the class of roots they make; some varieties, although they root readily, make a mass of fine, fibrous roots, and such sorts should be discarded at once, for they never grow freely. On the other hand, varieties that make strong, woody roots grow freely and produce strong, woody shoots. Roses and all hardy shrubs may be propagated successfully indoors from young, soft shoots, if stock plants can be kept indoors. By this method certain sorts that are normally difficult to root out-of-doors may be easily propagated.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF  
AILMA, Culzean Castle, Maybole, Ayrshire.

**Shrub Garden.**—This month is, perhaps, the best in all the year in which to make notes of plants that are doing well, but which may require more room to develop properly, and as many of them are at their best, to select places where they may be set later, so that their effectiveness may be enhanced. These notes will be found very useful when planting time arrives, as by then even the best of memories might be faulty. To name a selection of those in flower at present would be outside the scope of these notes, but never before has there been such a display on many of our half-hardy shrubs, and to see large plants of *Tricuspidaria lanceolata* with their blood-red, waxy flowers in the greatest profusion, alongside *Olearia macrodonta* when smothered in its white cloud of Daisy-like flowers, makes one realise that much remains to be done in placing our plants so that the best effects may be obtained. *Calceolaria violacea* has been most floriferous this season, vying with *Veronica Hulseana* in pale lavender shades, while that gem of the *Olearias*, *O. semi-dentata*, strikes a deeper note in purple, its large, single flowers on their six-inch foot-stalks being the admiration of all who see them. *Drimys Winteri* has also flowered well, its creamy tinted blossoms showing to advantage, and nearby the *Fuchsia*-flowered *Ribes*, *R. speciosum*, has produced its flowers, which hang along the undersides of last year's shoots, almost like a fringe of red wool.

**Melons.**—Main-crop Melons are in full growth and care will be needed to regulate the sub-laterals and keep them under control, as they seem to develop rapidly in almost a single night, and soon become strong, thus robbing the plant of nourishment required for the rapidly swelling fruits. Ample supplies of diluted and warmed liquid manure are of great assistance at this stage, and the paths and borders may be damped frequently with the same material, as the ammonia fumes which are given off help to keep insect pests in check, and are of great assistance in keeping the plants vigorous and healthy. Do not stop the leading shoots too severely, but allow them to grow freely for a time, as they will serve to draw up the sap. Later Melons should also be encouraged to grow freely by closing the house at the earliest possible moment after the direct rays of the sun have passed from it in the afternoons. When this is done, damp and syringe the plants with tepid water, always exercising the precaution so often advised, to prevent moisture collecting at the necks of the plants.

## REPUTATION

is not gained without continued good service and effect. Especially is this true about a weed-killer. Eureka does kill weeds, it has the largest sale and when using it you are certain of satisfactory results, it is full strength and never varies.

### "LITTLE WONDER"

A practical machine that will clip any variety and shape of hedge five to ten times as fast as the hand shears. It will do better work and make finer hedges with much less effort. Ten feet high hedges may be clipped right from the ground. Easily adjusted for top-cutting.

Strong, durable, efficient—a perfectly made and finished labour-saving machine that saves you money every time it trims a hedge.

The "LITTLE WONDER" Hedge Clipper has been used at the Royal Horticultural Society's Gardens at Wisley since 1924, and holds

THE AWARD OF MERIT BY THE R.H.S.

Used in the Royal Zoological Society's Gardens and many large estates throughout the country. Demonstrations arranged.

Send for illustrated booklet with prices or ask your dealer. (Free of duty for Ireland).

## FLOWER GARDEN.

## PHORMIUM TENAX.

ALTHOUGH this Liliaceous plant was introduced in 1798, its use in public parks and open spaces has not been so general as might reasonably be expected.

When planted as a bold group in a corner of the shrubbery, or by the streamside, it is extremely effective, and particularly when in flower. The leaves, which are ligulate and radicle, grow to a height of from three to five feet, and the many paniced inflorescence exceeds this height.

The individual flower is interesting; the perianth is carmine in colour and yellowish within; it is about one-and-half inch in length, and composed of six distinct and very tough segments which close together, to form a somewhat tubular and slightly curved structure. The six stamens are attached to the united base of these segments and have carmine-coloured filaments, which are equal in length to them, with the orange anthers extending for a further one-third-of-an-inch. The tri-carpellary ovary is about half-an-inch long, of a dull brown colour and surmounted by a curved style. The fruit forms a capsule practically as long as the flower, and when ripe, the whole inflorescence looks very distinctive for some time, as it remains until the next season's flowers are produced.

In Bermondsey, this plant has successfully withstood the dirt and cold of the past two winters, and has produced both flower spikes and seeds.

Quite recently, I had the opportunity of seeing one of the largest naturalised groups of this plant I have seen; it is situated over a fisherman's cove in Mounts Bay, quite close to the sea, and comprises some scores of plants, on which more than one hundred inflorescences were observed and nearly the same number of old fruiting canes. In this situation they easily held their own with the following strange companions: Bracken, Cow Parsnip, Honeysuckle, Foxglove, Dog Daisy, Red Campion, Robin-run-the-hedge, Spear Thistle, Toad Flax and Bramble, while on the other side of the cove stretched huge sheets of Mesembryanthemums, in full flower, glowing for a number of yards like a yellow satin garment right over the cliff face.

Just above the cove the Phormiums were used as a hedge plant, forming a very successful dividing line between two properties.

Some people hesitate to plant Phormiums, of which there are a number of beautiful kinds, on account of their reputed tenderness, but as they have proved successful in quite a number of places, and have been rarely damaged by frosts, there should be no hesitation in planting them.

Its prospects in this country as a commercial fibre-producing plant have often been discussed. W. H. Johns, Bermondsey Public Works and Gardens.

## TREES AND SHRUBS.

## RHODODENDRON SPHAERANTHUM.

(Supplementary Illustration.)

RHODODENDRON sphaeranthum, of which the fine specimen shown by Mr. A. M. Williams at the Rhododendron Society's Exhibition, on May 3, forms the subject of the Supplementary Illustration presented with this issue, is a native of Yunnan, where it was discovered by Mr. George Forrest growing in the mountains of the Feng Kow valley at an altitude of 12,000 to 13,000 feet.

It forms a small bush from eighteen inches to four feet high. The flowers vary from deep, clear rose to pure white, and the foliage is aromatic. The species is very near to R. lediodes, the differentiating characters being the lepidote and not puberulous rhachis of the inflorescence, the prophylls being much longer than the calyx, and the lepidote corolla. It belongs to the Cephalanthum series, and gained the

first prize in this section of Rhododendrons at the recent Rhododendron Society's exhibition. A full description of the species is contained in *Notes of the Royal Botanic Garden, Edinburgh*. 1926, p. 278.

## CERCIS RACEMOSA.

THIS comparatively new Judas Tree differs from the well-known *Cercis Siliquastrum* in producing racemes of flowers carrying as many as thirty to forty individual blossoms, each of which is about half-an-inch long, and rose-coloured. It was shown by Mr. Lionel de Rothschild at the recent Chelsea Show (May 25), and received the R.H.S. Award of Merit.

This species was first discovered by Mr. Augustine Henry in 1886, in the Provinces of Hupeh and Szechuen, but was not introduced to cultivation until Mr. E. H. Wilson sent seeds to Harvard University in 1907.

Mr. Wilson states that it is one of the most

also to be met with in the home counties. In the ordinary sense, the wood of this tree has no timber value, though it has supplied large quantities of "tree nails," especially for use in ship-building. In the early days of the motor-car the wood was used for wheel spokes, but the great vibration soon caused them to become loose, so the use of the Acacia wood was soon abandoned.

But the ornamental value of *Robinia Pseud-acacia* remains as great as ever, and fewer trees are more attractive than this with elegant, pinnate leaves, and pendulous racemes of white flowers. Varieties are fairly numerous, and for general garden decoration few are more valuable than *Decaisneana*, which is of vigorous habit and bears plenty of beautiful pink flowers. The variety *bella-rosea* is a dainty little tree of graceful habit. The leaves are distinctly smaller than those of the species, and the flowers are of rose-pink colour. During good seasons

FIG. 216.—CERCIS RACEMOSA.

R.H.S. Award of Merit, May 25, 1927.

beautiful flowering trees that he has introduced. In common with the older species, it develops its flowers on the old wood; the flowers are silvery-rose coloured, and a specimen in full bloom is a very attractive sight.

It forms a deciduous tree, growing some twenty feet high. Mr. Wilson states that it has a single trunk, from one to two metres in girth near the ground, and a wide-spreading head from four to ten metres through, consisting of relatively thin branches. He further states (*Plantae Wilsonianae*, Vol. II, p. 88): "The bark is green and smooth, but with age becomes pale grey, and splits into thin, irregularly oblong flakes which are partially exfoliated in old trees. When not in flower, the species is easily recognised by its habit, and by the leaves, which are hairy on the underside."

## THE ROBINIAS.

ALTHOUGH William Cobbett's dream of fortunes for all who would plant a few trees of *Robinia Pseudacacia* were not, and, indeed, in the order of things, could not be realised, it is due to his persistent insistence of the superlative value of this tree that so many large specimens grace the suburbs of London and are

the variety *semperflorens* fairly justifies its name for, from May to the end of the autumn, it nearly always is in flower. The variety *monophylla* is not consistent for, in addition to bearing solitary, entire leaves, it often has a couple, or even, occasionally, more leaflets, and in these cases the terminal leaflet is always like the entire leaf, enlarged. This variety flowers freely, though it lacks the grace of the varieties with normal pinnate foliage. The mop-headed Acacia so often planted in suburban front gardens is the variety *inermis*.

The Rose Acacia, *Robinia hispida*, bears the largest flowers of all the species and, when in bloom, is very showy for the flowers are of deep rose-pink colour. Its variety *macrophylla* has even larger flowers, but both are rather ungainly shrubs, rarely more than eight feet or nine feet in height. While they are all worth growing for the sake of their handsome flowers, they should not be planted in prominent positions. *Robinia Kelseyi* grows to about the same size as *R. hispida*, but it has a much better appearance. Its flowers are also large and of bright rosy-purple colour, and they are succeeded by red seed-pods. In my opinion it is the most beautiful of all the summer-flowering shrubs. A. C. B.

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden W.C. 2.

**Editors and Publisher.**—Our correspondents would oblige delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arises when letters are misdirected.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, &c. but they cannot be responsible for loss or injury.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron., Rand; or by telephone, to Gerrard, 1543.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

## IDEAL GARDENS AND PLANT LORE.

## II.—A. GROVE OF JUDAS TREES.

**D**URING the months of April and May, the observant traveller in the Levant and Italy, the Riviera and the Mediterranean Islands, cannot fail to have his attention arrested by the rich blossoms of a tree to be seen alike in the woods and in the gardens. The first thought, perhaps, is that he has come across a belated Almond; but this idea is soon rejected. The season is too late; the flowers have too deep a colour, and though the tree is leafless, and its shape is not unlike that of the Almond and its nearest relatives, the blossom is seen to have a different shape as well as a richer hue. If access can be gained to the tree, its true character is soon apparent. It grows to a height of some twenty or more feet, its flowers are papilionaceous and grow in purple clusters, usually denser than those of the Laburnum, and not so long. The blossoming season is succeeded by that of the pale green foliage and the long, flat pods containing a row of seeds. This is *Cercis Siliquastrum*, or Judas Tree, first introduced to this country in 1596, and described and illustrated in the *Botanical Magazine* t. 1, 138. I saw it two years ago in Italy, and again this year in Corsica and on the Riviera, and was so vividly reminded of the legends I had studied years ago that I resolved to make a Grove of Judas Trees in my Ideal Garden. For there are at least half-a-dozen trees which are traditionally associated with Judas the Traitor and his untimely end.

Gerarde, who devotes a chapter in his *Herbal* to the Arbor Judae, states that the Judas Tree "groweth up unto a tree of a reasonable bigness, covered with a dark-coloured bark, whereon do grow many twiggy tough branches of a brown colour, garnished with round leaves, like those of round Birthwort, or Sowbread, but harder, and of a deeper green colour; among which come forth small flowers like those of Peas, of a purple colour mixed with red, which turn into long, flat cods, pressed hard together, of a tawny or wan colour, wherein are contained small, flat seeds, like the Lentil, or rather, like the seed of Medica, fashioned like a little kidney. . . . This shrub is found in divers provinces in Spain; the mountains of Italy, and the fields of Langue-doc are not without this shrub; it groweth in my garden. The flowers come forth in the spring, and before the leaves; the fruit, or cods, be ripe in summer. . . . It may be called in English, Judas Tree, for that it is thought to be that whereon Judas did hang himself, and not upon the Elder tree, as is vulgarly said."

On the Continent the leaves are employed as a salad on account of their agreeable acidity. One of the most beautiful specimens I have seen grows in the grounds attached to the Park Hotel in Corte. A nearly related tree, *C. canadensis*, is a native of Canada, and the French Canadians pickle the leaves, while the buds and young branches "will dye wool of a fine nankeen colour." The wood of both species is beautifully veined with black. It was maintained in earlier times that the Judas Tree was a favourite haunt of witches who found great delight in gathering for evil purposes around a tree of such a sinister character.

M. De Gubernatis informs us that in Sicily this wild Carob is named *Arvulu di Giuda*, (*arbre de Judas*), or *Arvulu di Giudeo*, i.e., Tree of the Jew. Under this tree one may hear, in April and May, in the Riviera, the peculiar murmur of invisible bees, such as one hears in this country when the Lime trees are in flower. This soft buzzing sound has been a problem to naturalists, since it is frequently heard when not a single insect is to be seen. It has been made memorable by some lines from the pen of the poet Tennyson.

We have seen that in Gerarde's day the Elder tree, *Sambucus nigra*, was held to be the true Judas Tree. If we turn to Mandeville we shall find the reason for this. Between Jerusalem and the valley of Jehosaphat, says this quaint old traveller, "is still the Elder tree on which Judas hanged himself for despair, when he sold and betrayed our Lord." In some of the early editions of his *Travels* is to be found a very remarkable illustration of this. Langland, the author of *Piers Plowman*, accepts the tradition, and informs us (*Vision* 1, 67-8) that:—

Judas he japed with Juwen silver

And sitten on an Elder hanged him after.  
Professor Skeat's note on the passage gives us some useful references.

"The idea that Judas hanged himself upon an Elder occurs in Shakespeare, *Love's Labour's Lost*, Act V. 2, 600 [What do you mean, Sir? To make Judas hang himself. Begin, Sir, you are my elder. Well followed. Judas was hanged on an Elder]; and in Ben Jonson: 'He shall be your Judas, and you shall be his Elder tree to hang on' (*Every Man Out of Humour*, iv, 4). On the other hand, we read that the Arbor Judae (or *Cercis*) is thought to be that whereon Judas hanged himself."

He then alludes to Gerarde and Mandeville, to whom reference has already been made. We further find, in the Epilogue to a work by Lilly, entitled *Alexander and Campaspe*, written during the reign of Queen Elizabeth, a confirmation of this idea, showing that the Elder was held in low esteem, and was given as a token of disgrace, just as the Bay, Laurel and Parsley had been symbols of honour:—

"Laurel for a garland, or Elder for a disgrace."

In the sixteenth and seventeenth centuries, we find many allusions to the tradition which linked the death of Judas with the Elder. Thus in 1658, we read in Richard Flecknoe's *Diarium*:—

How Elder stick in pocket carried . . .

It had, he said, such virtuous force;

Where virtue oft from Judas came,

Who hanged himself upon the same.

A little later a reference is found to the "stinking Elder, on which tree that fox-headed Judas was falsely supposed to have hanged himself."

But the Elder did not hold undisputed sway as the Judas Tree any more than does the *Cercis*. The Fig was one of its rivals. Concerning this tree, which fills a large space in old time plant lore, we are informed that in Sicily it was maintained that it never flowered again or bore any fruit after Judas committed suicide, and that, indeed, the very tree on which he hanged himself was that which his Master had cursed. It is from this tree, by a strange process of reasoning, or lack of reason, that all the wild Fig trees are affirmed to have sprung into existence! M. Bianca informs us that it is imprudent to sleep under a Fig tree in the warm hours of summer, since the sleeper may be visited by a being of sinister habits. After Christ had cursed the barren tree it lost its

foliage and died. The wood, when placed in the fire, yielded only smoke and no flame. On the coast of Comandol, a Fig tree grew which bore the name of Judas' Purse.

It was not on a Fig tree, however, says another tradition, but on the Tamarisk, that Judas met with his untimely end. To those who know the Tamarisk only as it grows in this country, the idea seems absurd. There are however, specimens of this tree to be seen abroad, which would be quite big enough for a gallows, as I have myself seen. There are, moreover, two different forms of Tamarisk, the African species, *Tamarix africana*, being in some places more common than the Gallic form, *T. gallica*, and known in Sicily as *Vruca*. True, this is now only a shrub, but this is due to the fact that when it grew to the height of the tree it was used by Judas for his unholy purpose, and so fell under the divine malediction. "You are like the wood of the Vruca," says the proverb, "which yields neither ashes nor fire." It is added that "*L'ame de Judas tourne toujours autour du Tamarix, et se tourmente en voyant que son corps y demeure a jamais suspendu.*"

The next tree in our grove must be the Aspen. In the Ukraine it is still held that the leaves of this tree, *Populus tremula*, have never ceased to tremble, even though there is not the slightest breeze, since the day when Judas hanged himself thereon. It is to this that allusion is made in the Russian proverb: There is an accursed tree which trembles without ever a breath of wind. This tree supplied (according to one tradition) the wood for the Cross of Christ.

The Terebinth is another tree which calls for attention. "Though reduced to a shrub on the Riviera," writes the genial author of *Ligurian Natural History Notes* (p. 83), "the Terebinth must grow to the size of a tree in Palestine, for Judas is said to have hanged himself on a Terebinth." This small tree, *Pistacia Terebinthus*, which is common in Palestine and the Greek Islands, and extends westward from Egypt through Northern Africa, yields the Chian turpentine, with a pleasant, aromatic smell, which some years ago had a considerable vogue as a remedy for cancer.

Finally, we may mention the Elgantine. What the true Elgantine really was has been the subject of keen debate, but I will content myself with regarding it as the Sweet Briar, because there could be no more welcome addition to our shrubbery than this. The berries of the Elgantine are to this day known as Judas beeren or Judas berries. The Dog Rose was formerly regarded in Germany with ill-favour. Not only was it in some way associated with the Evil One, but legend states that it was cursed owing to Judas using it for hanging himself. Hence it is that the prickles of wild Roses point earthwards. For other notes on the trees associated with Judas, and for remarks on Judas' ears, the quaint fungus connected with the Elder, I may be permitted to refer to my *Flowers and Flower Lore*, pp. 187, 225.

Our grove of Judas Trees will contain some charming plants. The blossoms of the wild Carob, the Tamarix and the Elgantine can hardly be surpassed for beauty and fragrance, and those of the Elder are famous for other reasons. The Fig will yield us fruit, the Terebinth will supply us with turpentine and shade, while we may find in the study of the quivering Aspen leaves food for thought when in philosophic mood. *Hilderic Friend.*

## NOTES FROM WISLEY.

As a result of the late spring, the number of plants and shrubs in bloom in the gardens of the Royal Horticultural Society is exceptional, and must be far larger at the present time than at any other period of the year. To the attraction of the Rhododendrons and Azaleas, many of which are still flowering well, may now be added that of Roses, Delphiniums, Poppies, Irises and Water Lilies, while the rock garden is extremely gay with *Cistus* and innumerable brightly coloured rock plants and alpenes.

RHODODENDRON SPHAERANTHUM.

The outstanding plant in the rock garden is *Meconopsis Baileyi*, of which there is an extremely fine group (Fig. 217). It is a perennial and bears an irregular cyme of nodding flowers of a most glorious sky-blue colour; a ring of golden-yellow anthers adds to the beauty of the bloom. The species was originally found at an altitude of 11,000 feet, by Major Bailey during his journey through Tibet, in 1913, and from the slight material which he sent home it was incompletely described by Sir David Prain. Eleven years later it was found in flower at the very same spot by Captain Kingdon Ward, through whom it was introduced to cultivation. One of the essential factors for success in growing this plant is the provision of a cool rooting-medium. It obtained the R.H.S. Award of Merit in April, 1926, and a First Class Certificate on June 8, 1927. It is sometimes confused with *M. betonicifolia*, from which it may be distinguished by the fact that the stem leaves of *M. Baileyi* are auricled and its style is shorter.

Another plant in bloom in the rock garden, which has also very conspicuous flowers, is *Mimulus Whitecroft Scarlet*. The blooms are of such a very vivid orange-scarlet that it is necessary to put this plant in a place where it will not clash with or spoil the effect of others of a more delicate hue. Scarlet flowers are also produced by *Lychnis Haageana*, which has purple foliage and a large, purple calyx. Other plants in flower on the rock garden include *Veronica rupestris* and *Hypericum polyphyllum*, which are growing in large patches, *Delphinium* species, such as *D. Maackianum*, *D. Duhmbergii* and *Antirrhinum sempervirens*, a small, semi-prostrate plant with grey foliage and whitish flowers, which must have a dry place, well sheltered from rain in order to give the best results.

In the alpine house, *Campanulas*, such as *C. nitida alba*, *C. garganica* var. *erinus* and *C. garganica* var. *hirsuta* are in flower. The last, however, is seen to still better advantage in the open, where it is in flower with the variety *W. H. Paine*.

In the alpine house are also in flower *Helichrysum frigidum*, with tiny white flowers and a double, white-flowered form of *Silene alpestris*. A few *Primulas* are also in bloom, including the pale yellow *P. microdonta* and the variety *violacea* with meal-covered, purple trumpets. Although of very recent introduction, these *Primulas* are already proving valuable garden plants, and may also be seen flowering well in the wild garden near the site of the old fruit room.

In the field garden numbers of *Pyracanthas* are in bloom. One of the most conspicuous is *Pyracantha Rogersiana* var. *aurantiaca*, the creamy-white and strongly-scented blossoms of which almost completely hide the stems and foliage and make a good combination with those of *Ceanothus Wisley Blue* in flower beside it. *Grevillea thyrsoidea*, which is now in bloom against the Laboratory, attracts to its flowers very large numbers of hive bees, as does *Grevillea sulphurea*, which is blooming exceptionally freely this year.

Among the various flower trials, the delicate colours of the long-spurred *Columbines* and *Aquilegia* species attract considerable attention. Many of the strains sent in, however, are badly mixed, particularly in the case of named varieties. There are, nevertheless, some excellent strains of *A. glandulosa* and of *A. coerulesa* Mrs. M. Nicholls.

The bearded *Irises* also make a fine spectacle, and among other attractive varieties in flower may be mentioned the pale blue *Mdlle. Yvonne Pellitier*, the rather similar but less tall *Corida*, *Prosper Laugier* with maroon-coloured falls and standards shot with purple, and *Ero* with chestnut falls and yellow standards. To these may be added the rich purple *Cardinal*, *Romola* which is rather similar but not so free-flowering, and *Rhein Nixe*, with violet-purple falls and white standards. Good white-flowered varieties include *Istria* and *White Knight*, which blooms considerably later than the former variety, while good, self-coloured yellows include *flavescens* and the deeper *Amber*. The latter, however, is apt to fade quickly under the

influence of strong sunlight. An American variety which is somewhat out of the ordinary is seen in Lona, the flowers of which have a creamy-white ground, heavily speckled with brown and flesh-pink.

Several of the annual *Poppies* on trial have commenced to bloom, and among the first out are *Papaver apulum*, with rather small, scarlet flowers ringed with black, and some *Poppies* of the Shirley type named *Ryburgh Hybrids*. The latter are most decorative and, unlike many annual *Poppies*, will withstand transplanting even when they have attained to a considerable size. These particular plants were not sown at Wisley, but were sent as large seedlings in a cardboard box with little or no soil attached to the roots. *J. E. Grant White*.

FIG. 217.—MECONOPSIS BAILEYI FLOWERING AT WISLEY.

## NOTES FROM EDINBURGH.

ALPINES suffered least from the effects of late frosts, and at present the rock garden is a brilliant spot for those who are interested in that particular section of the garden.

One of the features is the perpendicular dry wall on which many suitable plants have established themselves to advantage. Numerous plants of *Ramondia pyrenaica* are flourishing beautifully and are in full flower. This is more surprising, as the wall has a due southern aspect, and the general opinion is that this particular plant should have its home on the north side. *Lewisia Cotyledon* has again produced many spikes of pretty, little, star-like flowers which, arising from the rosette of fleshy green leaves, make it an admirably suitable wall plant.

*Phyteuma comosum* is about to open its numerous whorled inflorescence of pointed,

blue and white flowers. It is one of the best of the *Campanulaceae* family, and should be included in the collection of wall plants in every garden. Young plants establish themselves quite rapidly when planted in chinks between the stones, and are not long in producing tap roots to search for moisture, even in a very limited space.

Another noteworthy wall plant, a native of the Tyrol, is *Daphne petraea*. It almost clings to the stones, so closely does it grow, and from its very dry situation it produced numerous flowers, rose-pink in colour.

Many other suitable plants are also in flower, and among these a large area is covered with *Aethionema Warley Hybrid* and its companion, *Aethionema schistosum*. It is remarkable how the members of this genus flourish and bloom

profusely with scarcely any moisture, and young plants break and start to flower the following year after they have been planted.

The *Meconopsis* family seems to be increasing in popularity, judging by the many enquiries to see the flowering plants and glean as much information as possible of how best to grow them successfully. From among the many species *Meconopsis betonicifolia* is a warm favourite. Robust in growth and bearing numerous large bright blue flowers on the stem, it rivals in beauty *Meconopsis grandis*. The majority of the species of this beautiful genus are biennial, and it seems a pity that this should make them unpopular to many enthusiasts. To those with limited space, good results may be obtained by sowing seeds very thinly in shallow fish boxes, and transplanting the seedlings when they are old enough in their permanent quarters. By this method, time is saved, and the pricking off into boxes and frames is obviated. The species suitable

for this method are *Meconopsis integrifolia*, *M. latifolia*, *M. Prattii*, *M. betonicifolia* and *M. rudis*.

In the moraine a remarkably pretty little plant named *Trifolium uniflorum* is at present in flower. It is of prostrate habit and produces numerous, delicate pink flowers, which are very attractive. It is a native of South Europe. The same family is well represented by *Erinacea pungens*. Well established specimens of this plant covered with blue flowers, among the prickly foliage, have attracted great attention. This *Erinacea* needs an abundance of sun and a dry situation. To obtain good results in propagation, cuttings should be inserted in pure sand in a sun frame, and liberal supplies of water given to ensure ample moisture and encourage root action.

From amongst the countless number of Irises two dwarf species are daily admired—*Iris cristata*, from the South-east United States, and *Iris ruthenica*, from North Asia. They are both beautiful and suited to the rock garden. They may be relied on to represent the Iris family for beauty and attractiveness.

In a damp, well drained spot in the bog, *Primula flexilipes* has again excelled itself by producing many handsome, lemon-yellow flowers. It is to be recommended as a beautiful plant and well worth cultivating. Many species and varieties of the *Candelabra* section of *Primula* are at their best in the wild garden. Groups of *Primula pulverulenta*, *P. japonica*, *P. helodoxa*, *P. Cockburniana*, etc., have brightened up the dark foliage of the countless *Rhododendrons* and added beauty to the surrounding shade-loving plants. A remarkable beautiful group of *Primula microdonta alpicola violacea* is flowering by the pond side. This recently introduced plant is one of the gems of the *sikkimensis* section. The flowers are violet-purple, thickly powdered with meal inside and fragrant. It loves a well-drained, moist situation, and is quite hardy.

Excellent blooms have been a feature of the several species of *Nomocharis* mentioned in recent notes, and this year *Nomocharis Mairei* var. *leucantha* is outstanding for the beauty of its flowers. The blooms are most attractive, with fimbriated petals and evenly-spotted all over with chocolate coloured spots.

The Chinese *Delphinium tatsienense* has opened some handsome flowers of a beautiful royal blue colour, borne on spikes two feet high. This species may be used to effect by planting it in bays at the foot of large rock faces, or it may be grouped in the front of the herbaceous border. The variety *alba* is also a very desirable plant.

*Cynoglossum nervosum* is a most attractive native of the Himalayan region. Its gentian-blue flowers, compact and dwarf habit, make it an extremely useful decorative member of the Borage family.

In a high mound, facing south-west, and in a dry situation, *Nepeta kokanica* is flowering profusely. Crowded heads of lavender-blue flowers, on erect stems, are produced from among the pale green foliage; few members of the *Labiatae* family are finer than this plant.

The pretty, dwarf, composite *Bellium bellidioides* is carpeting a dry, rocky face with its minute, Daisy-like flowers. It is very handsome and enjoys its warm, dry situation.

Another member of the same family and somewhat unique is *Chrysanthemum hispanicum radicans*. The flowers are white or yellow, sometimes tinged with pink, and the plant is very floriferous. It is a dwarf species and useful for clothing dry ridges.

The sub-aquatic Herb, *Xerophyllum asphodeloides*, is very graceful with its long, dense racemes of white flowers. It is a native of North America and succeeds best in peat. Care must be taken to ensure a sufficient supply of moisture at its roots. When planted in large masses it looks particularly attractive.

From amongst the many dwarf annuals, *Platystemon californicus* may be selected to furnish a profusion of bloom. Treated like other members of the Poppy family, it will repay with a wealth of star-like, soft yellow flowers. A. M. Cutcheon.

## LIME AND SOOT IN THE GARDEN.

LIME is a necessary component of all good garden soils; it corrects sourness and aids in the decomposition of organic garden manures. Peaty land, moist clays, black, soapy earths, and ground overburdened with humus are all benefited by liming. Lime may be applied in various ways—either in the form of gypsum (sulphate of lime), rough limestone, or ordinary slaked builders' lime (quicklime).

For the average garden, quicklime is undoubtedly the easiest to handle and the most effective, if used at the proper season. It should be well dug in the ground some considerable time before stable manure is put in, as it sets free ammonia as a volatile gas if it comes into direct contact with nitrogenous manures, thus causing waste of a valuable material.

A good test for sourness in the soil is to insert a piece of blue litmus-paper. If the paper quickly turns a reddish colour and remains red after drying, it is a sure sign that the soil is sour, and needs liming before plants can be expected to thrive in it.

A good dressing of quicklime at the rate of from 14 lbs. to 20 lbs. per square rod (or 8 ozs. to 10 ozs. per square yard) should be applied to ground needing it, some three to four weeks before planting time. It is well to leave the lime exposed, after spreading, for at least twenty-four hours during dry weather, before lightly digging it in just below the surface, for lime naturally sinks into the ground and so works its way downwards, sweetening the soil as it goes. Animal manures should not be added till just before planting takes place, for the reason explained above.

A fruitful source of sourness in gardens for which the best remedy is lime, is over manuring through too liberal a quantity being unconsciously applied over a number of years. It may easily happen through ignorance of the state of the ground prior to first working it. This can only be ascertained through ripe experience, or by chemical analysis.

As a remedy against club-root (or finger-and-toe disease) in Brassicas, Kohl Rabi and Turnips, lime is indispensable. It assists in opening up stiff soils, making them more easily tilled, and less cold and sodden during wet weather, owing to the ground being porous. Damp and sodden soils, no doubt, have much to do with the prevalence of club-root in many gardens.

For removing moss from neglected fruit trees such as Apples, Currants and Gooseberries, there are few more effective cures than a good dusting of lime, applied by hand, during dampish weather, or just after a shower of rain, in such a manner that the lime adheres to the damp moss. The result is soon apparent. In about a week's time the moss will be found to drop off, or come off quite easily when touched by the hand or a stiff painter's brush.

Numerous other uses to which lime may be put, and is very much needed, will occur to the reader, e.g., the making up of lime-wash for spraying plants and whitewashing the interiors of greenhouses, store-rooms and so forth.

As to soot, this is invaluable for many purposes—not only for protecting young and tender seedlings against the ravages of slugs and other insects, but also for making soot-water as a liquid manure and a host of other things. As a lawn-dressing there are few better materials than a compost made up of dry, sifted soil, ten parts; lime, one part; and soot, one part. This compost should, however, be made and well-blended a few days prior to use.

Slaked lime and soot, when mixed together in equal parts, make an excellent dressing for young and tender plants, such as Cabbage seedlings, Onions, Leeks, Carrots and Turnips (especially after thinning); but it should be noted that when soot and lime are first mixed together they at once enter into chemical combination, and emit strong and pungent ammonia fumes. These must be allowed to disappear entirely before the mixture is applied to plants. In the same way, soot itself is not only injurious, but destructive to young and tender plants, such as Lettuce seedlings, unless exposed for several days to the open air in such

a manner that rain or snow cannot touch it, for the simple reason that fresh soot, as obtained from the chimney-sweep, contains a goodly percentage of nitric acid, powerful enough to not only scorch but burn up any young green growth with which it comes into contact.

Amongst the numerous enemies of Celery, such as slugs, snails, the mole-cricket, and the maggot, the Celery fly appears to be indifferent to all attacks except occasional dustings of the leaves with soot, which should be done during the month of June on the mornings of days that promise to be sunny. A fine dusting will suffice to render the plant distasteful to the fly. If the soot is put on carelessly, it will do more harm than good. Amongst the enemies of Brassicas generally and the Turnip tribe must be numbered the dreaded Cabbage Flea (*Haltica oleracea*) and the Turnip Flea (*Haltica nemorum*), against the ravages of which no better remedy can be suggested than dustings of fine ashes or soot (or soot and lime mixed as afore-mentioned)—all such dustings being applied in the early morning, while the plants are wet with dew. To apply a dusting at midday, when the sun is high, is a mere waste of time.

Many plants, such as Perpetual Spinach, Peas and Corn Salad, all benefit, both as to colour and taste, by occasional dustings of soot, applied while the leaves are wet with dew or damp with rain after a shower. E. A. Saunders, Compton, Sussex.

## VEGETABLE GARDEN.

### PROLONGING THE CELERY SEASON.

In order to prolong the season when Celery is available, namely from September to the end of March, I start by sowing some good early white variety, such as Sutton's White Gem, in gentle heat, early in March, to have heads ready for use in September to October. Next I sow a somewhat later white variety, such as Sutton's Solid White or Dobbie's Invincible White, early in April, in boxes kept in a cold frame, the crop to be ready for consumption in October to November. I next sow a good pink variety, such as Dobbie's Favourite Pink, Carter's Giant Pink, or Sutton's Superb Pink, early in May, either out-of-doors or (preferably) in boxes in a cold frame, to provide edible Celery from November to January. Next I make a sowing of some good red variety, of which there are many kinds on the market, about the end of May, to furnish heads for use during the latter part of January and beginning of February. Finally, I make a fifth and last sowing of some such reliable late red kind as Dobbie's Selected Red, in the open in June, to provide good heads of Celery from February to March.

The only way in which the Celery season can be extended fully, apart from choice of seed, is by growing the plants in the usual way in high-level trenches (without collars), rather than by the old-fashioned, low-level trench system, for the simple reason that Celery grown in low-lying trenches, without proper drainage, is very liable to damp off and rot, whereas by the newer and more up-to-date system of high-level trenching such loss is almost impossible. E. A. Saunders, Havant, Hants.

### MAINCROP AND LATE CARROTS.

MAINCROP Carrots are usually sown in April or May, according to the soil and locality. Where conditions are considered good for Carrot production, it is not advisable to make large sowings at any period, but rather rely on frequent sowings each month from April to the end of July, or even early in August in favoured districts. Sow in rows made twelve to fifteen inches apart, according to the variety, and thin the seedlings early; in the first instance, allow the plants an inch apart, and later follow this by drawing every other root until those that are required to mature are four to six inches apart. Routine treatment consists in frequent hoeings, and never allowing the weeds in the actual rows to reach such dimensions

beneficial to the  
turf. I should be  
very sorry to be  
without such a val-  
uable implement."

H. PATTISSON &amp; CO., STANMORE, MIDDLESEX.

that their removal would cause undue soil disturbance.

Where the Carrot fly is known to be troublesome, some preventive measures should be adopted, such as timely and frequent applications of soot, or some other deterrent, during the danger period. Varieties for the above sowings will depend upon the nature of the soil and the purpose for which the roots are required. Where the soil is ideal, one of the Intermediate types, of which leading seedsmen have their own particular strains, may be used. On shallow or heavy land good results may be obtained by using Early Nantes or Chantenay.

About the end of October, those roots which have reached maturity will be ready for lifting, and to prevent loss from splitting or other causes some method of storing will be necessary. Store in sand in a cool shed, or clamp.

Except where it is desirable to produce fully-grown roots, a minimum should be allowed to reach this stage, as it is when fully developed and stored that Carrots are inclined to be woody in the centre; rather endeavour to obtain young roots from periodical sowings.

The late summer sowings should be allowed to remain in the ground (where this is possible) until the roots are required for use. In August make a sowing in a cold frame; the lights will not be necessary until later in the season, when conditions are less favourable. An alternative method is to sow on a well-drained site in the open where the plants may be covered by frames when this becomes necessary. *J. Wilson, Wisley.*

## FRUIT REGISTER.

### SOME GOOD MELONS.

THERE is a great number of varieties of Melons, as there are few kinds of fruit which may be raised by cross fertilisation with greater ease. Some few of the old varieties still hold their own; notwithstanding the wealth of good sorts, it is not difficult to make a selection of the best.

Of scarlet-fleshed Melons, Scarlet Premier has scarcely been surpassed, but it is now seldom grown; indeed, I fear that it has been lost to cultivation. The slightly oval fruit is highly coloured and most beautifully netted, the flesh thick, with a faint and delicious aroma.

The mantle of this fine fruit descended upon Blenheim Orange, one of the best scarlet Melons of all time; the fruits are medium to large, and of fine flavour; the plant has a good constitution and is very prolific. Blenheim Orange is not grown so extensively as formerly, but many noted growers still maintain a stock of this sort. Of the newer scarlet varieties King George is excellent, with a richly-coloured flesh, a thin and beautifully netted skin. Superlative, Sutton's Scarlet and A.I. are all possessed of first-rate qualities.

Perhaps no other white-fleshed variety has ever become quite so popular as Hero of Lockinge. It is a very adaptable Melon, succeeding as well in a frame or pit as in a house, and this adaptability, allied to fine flavour and good appearance, had had the effect of rendering it almost ubiquitous. Perhaps the best of the white-fleshed varieties of recent introduction is Universal, with large, bright yellow fruits and a prominently netted skin; the flesh is deep and of fine flavour.

William Tillery is a fine, old, green-fleshed Melon, now but seldom grown; the large, handsome fruits possess a dark green, thin skin, and the pale green flesh is of rich quality. A contemporary of this variety was Eastnor Castle, a very fine grower and cropper, producing fruits of first-rate quality; Ringleader, Emerald Gem and Best of All are other fine green-fleshed varieties. Earl's Favourite is also a much favoured Melon in this class.

This small selection combines old and new varieties and some, if not all of them, are outstanding from the wide choice of the last three decades; there are many others of undoubted merit, but few have withstood the test of time as have the older sorts mentioned. *Ralph E. Arnold.*

## FRUIT GARDEN.

### A FINE MORELLO CHERRY TREE.

WE are indebted to Mr. J. Batty, gardener at Skelton Castle, Skelton-in-Cleveland, the residence of Col. W. H. Wharton, for sending us the photograph of the very fine Morello Cherry reproduced in Fig. 218.

The tree was planted by Mr. Batty, thirty-five years ago, and measures forty-nine feet across, and fourteen feet in height. It is planted against a north wall. As will be seen on reference to the illustration, this fine tree was a mass of blossom this spring, and as the Morello Cherry is comparatively hardy it is to be hoped that the fruits have escaped injury by the recent frosts, and that Mr. Batty will have a bumper crop.

The Morello Cherry is one of the most consistent of all fruit trees in cropping; we have in mind trees that were planted many years ago and which have never failed to furnish fruits each season, and, added to this certainty of

much to be desired. It may be that this variety requires some special cultural treatment which I have not yet discovered.

Baldwin is an excellent sort in districts that are not liable to be visited by late spring frosts. The flowers open so early that they are frequently ruined by low temperatures. In favoured districts Baldwin is a consistent cropper, bearing heavy crops of good quality fruits. *Geo. H. Copley, N.D.H.*

## DEEP TRENCHING.

I HAVE only once seen deep trenching being carried out, that was in Ligure, North Italy. A strip some 150 or 200 yards long by about twenty yards, somewhat terraced, was being worked by three men, and more than half the work had been done when I saw it.

The trench was a good four-and-a-half feet

FIG. 218.—A LARGE MORELLO CHERRY TREE AT SKELTON CASTLE, SKELTON-IN-CLEVELAND.

a crop is the additional advantage that the Morello Cherry will grow and fruit splendidly on a north wall, where few other kinds would be a success.

### BLACK CURRANTS.

Boskoop Giant is, in my opinion, quite the best Black Currant in cultivation. The individual fruits are large, the bunches long, and the flavour of the fruits is excellent. The variety proves a ready host for the big bud mite, but prompt hand-picking of infested buds will hold this pest in check. Seabrook's Black is an excellent variety which shows greater powers of resistance to big bud mite than any other Black Currant grown. The bunches and the individual fruits are of medium size and good colour. The flavour is acceptable and the variety is a consistent bearer. The variety Goliath bears well, producing short, closely-packed bunches. It is a good Black Currant for exposed situations. The berries are of large size, and the flavour universally approved.

Black Grape is a very reliable cropper, but it never bears a heavy crop—at any rate, not in my garden. The bunches are so short that it is not possible to gather a large amount of fruit from one bush. The colour and flavour are so good, however, that nobody will regret growing this variety.

Blacksmith is a comparatively new sort which has not stimulated my enthusiasm so far. The berries are small and they ripen late. The crop is light and the flavour leaves

deep and perhaps about the same in width; when the workers stooped in their work they were completely hidden; when standing, only their heads could be seen from a distance. The work was done with tools like the French *Oroc de Montreuil*, with a short, three-foot, handle; this tool seems to be like that listed as Canterbury Hoe in English catalogues; and the deftness with which the men placed the clods where desired was admirable; occasional lumps of rock were heaved on to the surface for subsequent removal, but smaller stones were not taken out. There was no apparent difference between top- and sub-soils, and the hoefuls were put at all sorts of levels, irrespective of their source. Presumably, the patch had been similarly treated before.

Unfortunately, I was not able to make enquiries, as my remnants of Portuguese and Spanish, though quite effective for beggars and itinerant troubadours, was quite useless for innate enquiry into husbandry with Italians. The mode of treatment when the end of the patch was reached would have been interesting; I rather opined that probably the big trench was left open at the end and so would form a starting point in another year. In summer the place is thoroughly sun-scorched, but considerable irrigation from cheese-like tanks of reinforced concrete is provided.

Certainly on the "Old Red" drifts of my garden, it is well to avoid bringing up much subsoil. The French "primeur" does not seem to go in for much deep cultivation, and relies upon a very enriched top-soil. *H. E. Durham.*

**RASPBERRY STEM-BUD MOTH.**

(LAMPRONIA RUBIELLA, BJERK.)

The caterpillars of this moth are now feeding within the buds of Raspberries and Loganberries. The buds of these plants should be examined, and if the pest is present, control measures should be undertaken. The pest is easily detected because the bud which has been attacked withers and dies. It has been stated that top buds on the canes are the most liable to attack; under my conditions this is certainly not true. Infected buds may be found in all positions.

Examination of the canes and the removal of the infected buds by hand is the best method of control for small batches of canes. When the pest is present in large plantations, hand picking is not a practical proposition, and other control measures must be adopted. Spraying the canes with paraffin emulsion will be found a very useful aid in reducing the pest. The spray should be driven well into the buds because it is useless unless it actually reaches the caterpillars and for this reason spraying should not be delayed too long; if the caterpillars can be sprayed just after they have entered the buds they are much easier to kill.

Another point often overlooked in connection with this pest is the fact that not only are the buds on the Raspberry canes attacked, but also many of the young suckers just pushing through the soil. Any control measures that are undertaken should also be directed to the soil as well as the canes. *Somerset.*

**HOME CORRESPONDENCE.**

**Growth of Plants under Vitaglass.**—Listeners in amongst your readers who have heard me speak at one time or another about the value of sunlight, may be interested in a novel and arresting piece of independent testimony. It has just come to me from Kew. Some weeks ago, two boxes were each planted with six Lettuces, on the same day, one beneath ordinary glass, the other beneath the special glass which admits the sun's ultra-violet rays. They have been tended in exactly the same manner. When pulled on the same day and weighed, the weight at the end of six weeks of the six grown under ordinary glass was 8½ lbs.; of the six grown under Vitaglass, 9½ lbs., that is to say, the ultra-violet rays, and any others of value which Vitaglass may transmit, have added 1½ lb. to the weight of six Lettuces in six weeks. Under them the plants grew much sturdier, of a deeper shade of green and with bigger hearts. The Kew authorities are proceeding to test other plants of economic and dietetic value on the same lines. *C. W. Saleeby, M.D., F.Z.S., F.R.S.E.*

**Piercing Bowling Greens.**—In the interesting note on bowling greens, on p. 436, *W. G. R.* refers to the piercing of the greens in the autumn. When I first saw greens that had been treated in this manner, I concluded that the holes had been caused by the removal of weeds. The value was apparent in the following spring and summer for at every spot where the greens were pierced the grass had made luxuriant growth, showing that the turf had benefited greatly by the operation. *T.*

**The Early History of *Gladiolus primulinus* Hybrids.**—Among the names of those who realised very soon after its introduction that *Gladiolus primulinus* provided valuable new "blood," that of the French firm of Cayeux and Le Clerc should not be forgotten. They probably started raising seedlings as early as M. Lemoine, and on August 27, 1908, they showed a collection of unnamed seedlings at the autumn show of the Société Nationale d'Horticulture de France, at Paris. This it will be seen is some years before any English-raised hybrids were exhibited. It would seem, therefore, that to Dr. Van Fleet, Lemoine and Cayeux and Le Clerc must be given the credit for the first *primulinus* hybrids, and to Messrs. Lemoine the credit (or otherwise) for the first named variety, in 1908. The fact that some English journalists were not aware of this does not alter

the historical fact. History, horticultural or other, so often falls back on "following the authorities," where facts are unobtainable, but surely, we who live so near to the facts can do a little better than that. *Edward A. Bunyard.*

**Pollination of *Schizanthus*.**—During the last month, I have been pollinating my plants of *Schizanthus*. I grow some half-dozen or more strains, and in order to keep each strain distinct, the plants are kept in a cool greenhouse from which bees and butterflies are excluded. I apply the pollen of each variety to the stigmas of the same variety by means of a small camel-hair brush, a separate brush being used for each strain, so that there shall be no intermingling of pollen, thereby diminishing the distinctive colours and markings of the several strains. What has attracted my attention is the great difference there is in the strains in the amount of pollen, and in the number of seeds produced in the seed-pods. The scantiness of pollen compels me to select special plants in some strains or fertilisation would become almost impossible and the strain die out. This is especially the case with that variety in which the bloom is pure white with a black blotch. I should be grateful if those who specialise in *Schizanthus* would inform me whether fertility is best assured by applying to the stigma pollen from the same bloom, from another bloom from the same plant, or from a bloom of another plant. The *Schizanthus* is protandrous, and when the anthers dehisce and expose the pollen, the style and stigma are undeveloped and remain so for several days. In the still air of a greenhouse the pollen is not, of course, removed as it would be out-of-doors, and remains therefore still available when the style has come forward and turned upward and the stigma become receptive. Usually I have chosen pollen from another bloom or plant rather than that from the individual bloom itself. An interesting physiological problem is the reason (or purpose?) why some blooms are completely self-sterile, e.g., Coe's Golden Drop Plum, and some others completely cleistogamous, such as the Sweet Pea, in which cross-fertilisation can only be effected by what may be termed an act of violence. Though generally "crossing" appears to be advantageous, it is not an universal necessity. *J. E. Shaw.*

**Gladiolus.**—I am much obliged to Mr. Edward A. Bunyard for his notes on Gladioli on page 417 of your issue of June 11. I would be grateful to others who would add to our information concerning Gladioli and their origin. In time there could be compiled an authoritative monograph. I wish it could be proved that the *Gandavensis* section originated in England, as is suggested by Mr. Bunyard, and that it could have been launched under an English name in the same way as the *Langrim* section, now popularly called *Primulinus* hybrids. Some of Mr. Bunyard's corrections would not have been made if he had realised that my article was being printed in parts, and that he had not read all that I had to say. For I do give credit to Mr. Standish, and although I did not know that he had sent out so many varieties, I used to hear my grandfather speak of him and his varieties with respect. I have, of course, not been able to glean any records from that quarter. And I mentioned *G. Brechleyensis* also; but my grandfather would never agree that there was any evidence of *G. psittacinus* blood in this section. Mr. Bunyard's notes, I am glad to see, suggest that once more England has led the way in progress. Continental peoples are quick to exploit what we invent or raise, our commercial instincts apparently not being so highly developed as their own. I particularly stated in my article that I was merely trying to give an impartial account, so far as my information goes; my notes are based on memory and on memoranda placed from time to time through a long period of years in a drawer of my desk. Apparently, Mr. Bunyard's horticultural library is better stocked than my own. But between us we could show that the *Gladiolus* family did not originate to-day, nor even yesterday, but is the *summum bonum* of the work of several generations of ardent, patient labourers. *James Kelway.*

**SOCIETIES.****ROYAL HORTICULTURAL.**

JUNE 21 AND 22.—The usual fortnightly meeting was held on Tuesday and Wednesday last in the Society's Hall, Vincent Square, Westminster. The exhibition comprised good groups in the various sections, but the whole of the space was not filled, and the attendance was only moderate.

The Orchid Committee made one award to a novelty. The Floral Committee granted eight Awards of Merit. The most important exhibits before the Fruit and Vegetable Committee were a collection of pot fruit trees, and another of varieties of Melons, the latter from Lord Leconfield's gardens.

**Orchid Committee.**

**Members present:**—Sir Jeremiah Colman, Bart. (in the chair), Mr. Gurney Wilson (Secretary), Mr. Clive Cookson, Mr. A. Dye, Mr. Fred Sander, Mr. H. S. Alexander, Mr. J. Cypher, Mr. J. E. Shill, Mr. A. McBean, Mr. John Cowan, Mr. J. Wilson Potter and Mr. E. R. Ashton.

**AWARD OF MERIT.**

*Miltonia Lycaena* var. *Franconia* (Princess Margaret × Lord Lambourne)—From FRANK MERCEB, Esq., Clovelly, Steyning. A fine advance in size and colour. The plant bore three large flowers, the petals of which are unusually broad, and with much crimson colouring. The flatly displayed labellum has a light reddish-brown blotch with radiating lines, and a purplish suffusion on the central area.

**CULTURAL COMMENDATION.**

To Messrs. J. AND A. McBEAN, Cooksbridge, Sussex, for a well-grown plant of *Anguloa Ruckeri* with eleven flowers.

**GROUPS.**

Messrs. COWAN AND CO., Southgate, exhibited a group in which *Cypripedium Curtisii* Sanderae and *C. Maudiae* stood out prominently. The attractive *Odontoglossum Williamsianum* and several varieties of *O. crispum* xanthotes were arranged together with *Odontioda Chantecler* and large-flowering *Miltonias* of the vexillaria section. Along the back were *Cattleya Harold alba*, a richly coloured form of *C. Dupreana*, and the pure white *C. Mossiae* Wageri.

Messrs. CHARLESWORTH AND CO., Haywards Heath, had several attractive forms of *Laelio-Cattleya Aphrodite* in their exhibit, arranged with the white-flowering *Cattleya* Mrs. Myra Peeters and the rose-coloured *Wilsonara insignis*. *Miltonia* hybrids were a feature and included distinct varieties of *M. gattonensis*, *M. Lucia*, rich crimson, and *M. Princess Mary*. *Lycaste aromatica* and *Odontioda Queen Mary* were also included in this exhibit.

Messrs. SANDERS, St. Albans, showed several interesting Orchids, such as *Maxillaria tenuifolia*, *Paphinia cristata*, *Trichopilia lepida* and the pretty *Vanda suavis colorata*. Other noteworthy plants were *Brassavola Digbyana*, from which numerous hybrids have been raised, *Coelogyne Stanny*, with greenish-yellow flowers, *Dendrobium Victoriae* Reginae, slate-blue, and the curious *Masdevallia Shuttleworthii*.

Messrs. STUART LOW AND CO., Jarvisbrook, Sussex, arranged a group in which the central object was a well-flowered plant of *Dendrobium thyrsiflorum*, surrounded by good forms of *Cattleya Mendelii*, *Cattleya Mossiae* var. *King of Spain*, and *C. Tityus*. *Laelio-Cattleya Aphrodite* is a showy hybrid, while *Cattleya Woltersiana*, with a spike of four large mauve-coloured flowers, also met with appreciation. Plants of *Aerides virens* and *Dendrobium suavisissimum* were both well-flowered.

Messrs. J. AND A. McBEAN staged *Cattleya Warscewiczii* var. *Profusion*, with five large flowers, *Laelio-Cattleya Warrior* var. *Imperator*, and *Odontioda Thela*, an object of good cultivation.

Messrs. H. G. ALEXANDER, LTD., staged

*Miltonia Hyeana* var. *Garnet*, with a bold crimson blotch on the base of the lip.

The Executors of the late Mr. H. T. PITT, Stamford Hill, showed *Miltonia* Wm. Pitt var. *Dusky Monarch*, of rich crimson colour, and generally regarded as one of the best of its kind.

#### Floral Committee.

**Present:** Section A.—Mr. H. B. May (in the chair), Mr. Arthur Turner, Mr. J. M. Bridgeford, Mr. D. Ingamells, Mr. A. Vasey, Major G. Churcher, Mr. G. W. Leak, Mr. Charles E. Pearson, Mr. Donald Allan, Mr. James B. Riding, Mr. E. R. Jones and Mr. Courtney Page.

Section B.—Mr. Gerald W. E. Loder (in the chair), Mr. Charles T. Musgrave, Sir William Lawrence, Mr. Hiatt E. Baker, Mr. G. Yeld, Mr. A. Williams, Mr. R. W. Wallace, Mr. L. R. Russell, Mr. Mark Fenwick, Hon. Henry D. McLaren, Mr. Reginald Cory, Mr. W. B. Cranfield, Mr. George Harrow, Mr. G. Reuthe, Mr. Amos Perry, Mr. F. G. Preston, Mr. James Hudson, Mr. E. H. Wilding, Mr. R. D. Trotter and Mr. N. K. Gould, Secretary.

#### AWARDS OF MERIT.

*Alstroemeria haemantha* B. Ladhams.—Of recent years *A. haemantha* has given rise to a number of beautiful varieties with larger flowers which appear to be somewhat harder than the species. The present variety has a goodly umbel of beautiful, soft pink-coloured flowers. Shown by Messrs. B. LADHAMS, LTD.

*Escallonia Donard Gem*.—This is a very floriferous variety of *E. langleyensis* type bearing pale rose coloured flowers. Shown by THE DONARD NURSERY CO.

*Azalea Benikirin*.—A dwarf Japanese *Azalea* of somewhat spreading habit. It bears relatively large, semi-double, bright orange-salmon coloured flowers which have small, dull crimson spots. Shown by Mr. AMOS PERRY.

*Paeonia Globe of Light*.—A beautiful, single, herbaceous *Paeony*. The large flowers are of soft pink colour, paler at the margins, and there is a large cluster of yellow filaments. Shown by Messrs. KELWAY AND SON.

*Paeonia Orion*.—A very bright, single-flowered, herbaceous *Paeony*. The round flowers have substantial ruby-coloured petals, and the compact cluster of filaments are rich yellow splashed with ruby. Shown by Mr. W. B. CRANFIELD.

*Lilium concolor*, *Dropmore* variety.—This is a brilliantly coloured variety of the Chinese Orange Lily which is figured in *Bot. Mag.*, tab. 1,165. It appears to have been raised in Manitoba, and has only a sentimental connection with *Dropmore*. Mr. AMOS PERRY informs us that the plant grows to about two feet in height. The widely opened flowers are of rich orange-red colour with a ray of small crimson spots. Shown by Mr. AMOS PERRY.

*Calceolaria* sp., A. C. 405.—The seed of this useful *Calceolaria* was collected by Mr. Coomber in the Andes, and plants have been grown, unprotected, at Stevenage for over a year. The plant has large, ovate leaves of harsh texture and covered with long hairs. It appears to be exceedingly free-flowering and will probably prove to be a valuable border plant. The flowers, which are about the size of those of *C. amplexicaulis*, are of bright yellow colour and have a characteristic lobing of the pouch. Shown by Mr. CLARENCE ELLIOTT.

*Cistus cyprinus immaculatus*.—This seems to be a very vigorous variety. It bears large white flowers which have a small, primrose-yellow zone. Shown by Sir WILLIAM LAWRENCE, Bt., Burford, Dorking.

#### FOR TRIAL AT WISLEY.

*Rose Abol*.—This is a well-formed, free-flowering H.T. variety. The blooms are fully double, milky-white with flesh-pink colouring in the centres of the blooms, which are pleasantly fragrant. Shown by the CHALK HILLS NURSERY CO.

*Dianthus Elizabeth*.—A very fine garden Pink. The flowers have the appearance of

miniature Florists' Carnations and are of rich orange-red colour, with a ray of small crimson spots.

*Dianthus Othello*.—This is a rather larger garden Pink and fully double. The flower is of rich crimson colour, flushed with dark maroon. Both varieties, which are fragrant, were shown by Mr. C. H. HERBERT.

#### GROUPS.

Delphiniums were the principal floral feature of the show, and these were shown in especial magnificence by Messrs. BLACKMORE AND LANGDON, who had tall, imposing stands filled with superb spikes of bloom. Their chief varieties were *Purple King*, of rich colour; *Phyllis*, bright lavender; Mrs. Townley Parker, pale blue; Lord Derby, reddish-mauve; Constance, sky-blue with white eye; Blue Boy, rich blue with white eye; and Mrs. Colin McIver, dull mauve.

On the other side of the entrance, Messrs. KELWAY AND SON had a large group of Delphiniums and Paeonies. The former included *Smoke of War*, Sir Alfred Keogh and Rev. E. Lascelles. The chief of the single Paeonies were *Globe of Light*, pink; Sir Henry Stone, rose; and *Moonlight*, white. Amongst the double varieties were Dr. Bovanian, rose; Langport Triumph, blush; Alsace, ruby; and General Buller, deep rose. Mr. T. CARLILE had some good spikes of Delphiniums associated with Gaillardias. His Delphiniums included Henley, dark blue with white eye; Triumph, lavender; Fair Lady, pearly lavender; and Madame A. Nonin, pale blue.

In a well-arranged corner group, Messrs. M. PRICHARD AND SONS displayed many good Delphiniums with Tritomas, Campanulas, Oriental Poppies, Heuchera and a goodly collection of garden Pinks.

Delphiniums were well arranged with Paeonies and Irises by Messrs. R. H. BATH, LTD. Chief amongst the double Paeonies were Sarah Bernhardt, pink; Madame Emile Lemoine, white; Graziella, cream, and Madame Moutot, rose. Their single varieties included Abiah, rose; Aurora, ruby; Labades, purple; and Torpilleur, pink.

THE CHALK HILLS NURSERY CO. had an interesting collection of Oriental Poppies, Delphiniums, Campanulas and other seasonable border flowers. Messrs. WM. WOOD AND SONS also set up an attractive collection, in which *Astilbes*, *Geums*, *Armeria* Bees' Ruby and *Delphinium nudicaule* were prominent. In an exhibit by Messrs. G. AND A. CLARK, we noted some good *Eremurus*, Campanulas, Scabiosas, Irises and Delphiniums. A central stand of *Tricuspidaria Hookeri* in the display of Mr. G. REUTHE drew attention to various *Ericas*, an orange-coloured variety of *Azalea macrantha*, Lupines, *Dianthus*es and various alpine.

Mr. AMOS PERRY had a very attractively-arranged exhibit which contained a number of Tritomas of which the chief were The Beacon, caulescens and some elegant *gracilis* seedlings. He also showed a good batch of *Orchis foliosa*, and the uncommon *L. Washingtonianum*. In the centre of his group Mr. W. WELLS had a large stand of the graceful *Gypsophila* Boston Fairy, and also showed Campanulas, Delphiniums and *Erigeron* Pink Pearl. Several varieties of the dwarf *Thymus Serpyllum* were staged by Messrs. WATERER, SONS AND CRISP, and they also displayed dwarf Musk, dwarf Campanulas, and the blue *Moltkia petrea*.

In a collection arranged by Messrs. BAKERS, LTD., there were good spikes of Delphiniums, *Lychnis Viscaria splendens plena*, Lupins and Giant Thrift.

An especially valuable collection of English Irises and late-flowering species was shown by Messrs. BARR AND SONS. The former included *Duchess of York*, of rich blue colour; Prince Mauritz, rosy-purple; King Conrad, purple and Prince of Wales, bright blue. The taller-growing Irises included I. Monnieri, of rich colour; I. monaurea, bearing bright yellow flowers; I. ochracea and I. ochroleuca Queen Victoria. A large exhibit of seasonable border flowers was set up by Messrs. D. LADHAMS, LTD. In the centre there was a collection of the taller Campanulas, including the new variety

Locarno, bearing large, rounded, shining blue flowers. They also displayed vases of *Heuchera* in variety, *Betonica superba* and *Astrantias*. Messrs. STEWART AND SON showed English Irises, useful varieties of *Glaucidium Colvillei*, Alliums and a neat collection of alpine. The Misses HOPKINS and Messrs. MAXWELL AND BEALE had seasonable rock garden exhibits, and the latter had various dwarf *Ericas* and *Kalmias*. Messrs. TUCKERS, LTD., showed Delphiniums, *Aquilegia pyrenaica*, *Primula capitata* and other useful hardy plants. Delphiniums, and garden Pinks were staged by Mr. H. G. LONGFORD.

In the Annexe, Mr. C. H. HERBERT had a delightful collection of his border Pinks, which included several of the varieties we admired at the Chelsea Show. Mr. J. KLINKERT showed Topiary specimens.

An interesting collection of Lilius was contributed by Messrs. WALLACE AND CO., who had *L. Martagon album*, *L. regale*, *L. japonicum* and *L. umbelliferum* Sappho. Mr. J. ROBINSON showed various rock plants, including dwarf Thymes and Pinks. Mr. W. J. UNWIN again set up an attractive exhibit of the variety *Coonara* of the Iceland Poppy.

An interesting collection of shrubs was staged by THE DONARD NURSERY CO. The chief feature was a collection of varieties of *Lep-tospermum* of considerable merit. They also showed *Tricuspidaria lanceolata*, *Ozothamnus rosmarinifolius* and *Escallonia*s. Mrs. CARL HOLMES, The Node, Welwyn, exhibited a collection of *Gerbera Jamesonii* seedlings. Messrs. J. CHEAL AND SONS staged *Dahlia* blooms, chiefly of the Star, Mignon and dwarf Decorative types.

Sweet Peas of great merit were shown by Messrs. DOBBIE AND CO. In addition to the varieties Hero, Sunkist, Prince of Orange, Camellia and Pinkie, which we noted at the previous meeting, they had *Gleneagles*, a splendid lavender variety, and *Flamingo*, of brilliant orange-cerise colour. Messrs. S. BIDE AND SONS had a general collection of Sweet Peas, which included *Alma Beauty*, *Constance Hinton*, *Charming*, *King Mauve*, *Winifred McLaughton* and *George Shawyer*.

Small collections of Roses were shown by Messrs. B. R. CANT AND SONS, Mr. J. H. PEMBERTON and Messrs. GEORGE BUNYARD AND CO. The former included *Scarlet Climber*, *Pink Pearl*, *Cupid* and *Lemon Pillar*. Mr. PEMBERTON staged The General, Francesca, Los Angeles, Vanity and Mrs. Henry Morse, while the last-named again showed a valuable collection of old-fashioned Roses, including *Petite d' Hollande* and *cristata*, two pretty Moss Roses; the *Provence Rose* and *Cottage Maid*.

Carnations were staged by Messrs. C. ENGELMANN, LTD., who had good vases of Topsy, Red Laddie, Peerless and Arnos Grove, while Messrs. ALLWOOD BROS. had George Allwood, Wivelsfield Apricot, Mary Allwood and a collection of *Dianthus* Allwoodii. Several good vases of *Malmays* were set up by Messrs. STUART LOW AND CO., who also showed Brilliant, Eileen Low and Topsy, of the perpetual type.

An especially well-arranged group of stove and greenhouse plants was displayed by Messrs. JOHN PEED AND SON. They had superb plants of *Dracaena Victoria*, various well-coloured *Codiaeums* (Crotons), many well-grown *Caladiums*, *Hydrangeas* and goodly groups of *Gloxinias* and *Streptocarpus*.

A smaller but also a tastefully arranged exhibit of stove plants was made by Messrs. L. R. RUSSELL, LTD., who included highly coloured *Codiaeums*, *Medinilla magnifica*, *Anthurium crystallinum* and *Dracaena Victoria*.

A large space was well-filled by Messrs. SUTTON AND SONS with superb batches of *Streptocarpus*. The flowers were unusually large and of high quality. The plants were arranged in colour groups and of their Giant strain. The principal colours were blue, mauve, pink, deep pink, rose, purple and white.

The competition for the Mrs. E. Harding Cup was a little unfortunate in point of numbers, but the collection of W. B. CRANFIELD, Esq., East Lodge, Enfield Chase, which won the Cup, was of great merit. His six vases included

**RASPBERRY STEM-BUD MOTH.**

(LAMPRONIA RUBRILLA, BJERK.)

THE caterpillars of this moth are now feeding within the buds of Raspberries and Loganberries. The buds of these plants should be examined, and if the pest is present, control measures should be undertaken. The pest is easily detected because the bud which has been attacked withers and dies. Brechleyensis* also; but my grandfather would never agree that there was any evidence of *G. psittacinus* blood in this section. Mr. Bunyard's notes, I am glad to see, suggest that once more England has led the way in progress. Continental peoples are quick to exploit what we invent or raise, our commercial instincts apparently not being so highly developed as their own. I particularly stated in my article that I was merely trying to give an impartial account, so far as my information goes; my notes are based on memory and on memoranda placed from time to time through a long period of years in a drawer of my desk. Apparently, Mr. Bunyard's horticultural library is better stocked than my own. But between us we could show that the *Gladiolus* family did not originate to-day, nor even yesterday, but is the *summum bonum* of the work of several generations of ardent, patient labourers. *James Kelway.*

**SOCIETIES.****ROYAL HORTICULTURAL**

JUNE 21 AND 22.—The usual fortnightly meeting was held on Tuesday and Wednesday last in the Society's Hall, Vincent Square, Westminster. The exhibition comprised good groups in the various sections, but the whole of the space was not filled, and the attendance was only moderate.

The Orchid Committee made one award to a novelty. The Floral Committee granted eight Awards of Merit. The most important exhibits before the Fruit and Vegetable Committee were a collection of pot fruit trees, and another of varieties of Melons, the latter from LORD LECONFIELD'S gardens.

**Orchid Committee.**

**Members present:**—Sir Jeremiah Colman, Bart. (in the chair), Mr. Gurney Wilson (Secretary), Mr. Clive Cookson, Mr. A. Dye, Mr. Fred Sander, Mr. H. S. Alexander, Mr. J. Cypher, Mr. J. E. Shill, Mr. A. McBean, Mr. John Cowan, Mr. J. Wilson Potter and Mr. E. R. Ashton.

**AWARD OF MERIT.**

*Miltonia Lycæna* var. *Franconia* (Princess Margaret × Lord Lambourne)—From FRANK MERCER, Esq., Clovelly, Steyning. A fine advance in size and colour. The plant bore three large flowers, the petals of which are unusually broad, and with much crimson colouring. The flatly displayed labellum has a light reddish-brown blotch with radiating lines, and a purplish suffusion on the central area.

**CULTURAL COMMENDATION.**

To Messrs. J. AND A. McBEAN, Cooksbridge, Sussex, for a well-grown plant of *Anguloa Ruckeri* with eleven flowers.

**GROUPS.**

Messrs. COWAN AND CO., Southgate, exhibited a group in which *Cypripedium Curtisii* Sandersae and *C. Maudiae* stood out prominently. The attractive *Odontoglossum Williamsianum* and several varieties of *O. crispum* xanthotes were arranged together with *Odontioda Chantecler* and large-flowering *Miltonias* of the vexillaria section. Along the back were *Cattleya Harold alba*, a richly coloured form of *C. Dupreana*, and the pure white *C. Mossiae Wageneri*.

Messrs. CHARLES WORTH AND CO., Haywards Heath, had several attractive forms of *Laelio-Cattleya Aphrodite* in their exhibit, arranged with the white-flowering *Cattleya* Mrs. Myra Peeters and the rose-coloured *Wilsonara insignis*. *Miltonia* hybrids were a feature and included distinct varieties of *M. gattonensis*, *M. Lucia*, rich crimson, and *M. Princess Mary*. *Lycaste aromatica* and *Odontioda Queen Mary* were also included in this exhibit.

Messrs. SANDERS, St. Albans, showed several interesting Orchids, such as *Maxillaria tenuifolia*, *Paphinia cristata*, *Trichopilia lepidota* and the pretty *Vanda suavis colorata*. Other noteworthy plants were *Brassavola Digbyana*, from which numerous hybrids have been raised, *Coelogyne Stanny*, with greenish-yellow flowers, *Dendrobium Victoriae Reginae*, slate-blue, and the curious *Masdevallia Shuttleworthii*.

Messrs. STUART LOW AND CO., Jarvisbrook, Sussex, arranged a group in which the central object was a well-flowered plant of *Dendrobium thyrsoiflorum*, surrounded by good forms of *Cattleya Mendelii*, *Cattleya Mossiae* var. *King of Spain*, and *C. Tityus*. *Laelio-Cattleya Aphrodite* is a showy hybrid, while *Cattleya Woltersiana*, with a spike of four large mauve-coloured flowers, also met with appreciation. Plants of *Aerides virens* and *Dendrobium suavisissimum* were both well-flowered.

Messrs. J. AND A. McBEAN staged *Cattleya Warscewiczii* var. *Profusion*, with five large flowers, *Laelio-Cattleya Warrior* var. *Imperator*, and *Odontioda Thela*, an object of good cultivation.

Messrs. H. G. ALEXANDER, LTD., staged

*Miltonia Hyeana* var. *Garnet*, with a bold crimson blotch on the base of the lip.

The Executors of the late Mr. H. T. PITT, Stamford Hill, showed *Miltonia* Wm. Pitt var. *Dusky Monarch*, of rich crimson colour, and generally regarded as one of the best of its kind.

#### Floral Committee.

**Present:** Section A.—Mr. H. B. May (in the chair), Mr. Arthur Turner, Mr. J. M. Bridgeford, Mr. D. Ingamells, Mr. A. Vasey, Major G. Churcher, Mr. G. W. Leak, Mr. Charles E. Pearson, Mr. Donald Allan, Mr. James B. Riding, Mr. E. R. James and Mr. Courtney Page.

Section B.—Mr. Gerald W. E. Loder (in the chair), Mr. Charles T. Musgrave, Sir William Lawrence, Mr. Hiatt E. Baker, Mr. G. Yeld, Mr. A. Williams, Mr. R. W. Wallace, Mr. L. R. Russell, Mr. Mark Fenwick, Hon. Henry D. McLaren, Mr. Reginald Cory, Mr. W. B. Cranfield, Mr. George Harrow, Mr. G. Reuthe, Mr. Amos Perry, Mr. F. G. Preston, Mr. James Hudson, Mr. E. H. Wilding, Mr. R. D. Trotter and Mr. N. K. Gould, Secretary.

#### AWARDS OF MERIT.

*Alstroemeria haemantha* B. Ladhams.—Of recent years *A. haemantha* has given rise to a number of beautiful varieties with larger flowers which appear to be somewhat harder than the species. The present variety has a goodly umbel of beautiful, soft pink-coloured flowers. Shown by Messrs. B. LADHAMS, LTD.

*Escallonia Donard Gem*.—This is a very floriferous variety of *E. langleyensis* type bearing pale rose coloured flowers. Shown by THE DONARD NURSERY CO.

*Azalea Benikirin*.—A dwarf Japanese *Azalea* of somewhat spreading habit. It bears relatively large, semi-double, bright orange-salmon coloured flowers which have small, dull crimson spots. Shown by Mr. AMOS PERRY.

*Paeonia Globe of Light*.—A beautiful, single, herbaceous *Paeony*. The large flowers are of soft pink colour, paler at the margins, and there is a large cluster of yellow filaments. Shown by Messrs. KELWAY AND SON.

*Paeonia Orion*.—A very bright, single-flowered, herbaceous *Paeony*. The round flowers have substantial ruby-coloured petals, and the compact cluster of filaments are rich yellow splashed with ruby. Shown by Mr. W. B. CRANFIELD.

*Lilium concolor*, *Dropmore* variety.—This is a brilliantly coloured variety of the Chinese Orange Lily which is figured in *Bot. Mag.*, tab. 1,165. It appears to have been raised in Manitoba, and has only a sentimental connection with *Dropmore*. Mr. AMOS PERRY informs us that the plant grows to about two feet in height. The widely opened flowers are of rich orange-red colour with a ray of small crimson spots. Shown by Mr. AMOS PERRY.

*Calceolaria* sp., A. C. 405.—The seed of this useful *Calceolaria* was collected by Mr. Coomber in the Andes, and plants have been grown, unprotected, at Stevenage for over a year. The plant has large, ovate leaves of harsh texture and covered with long hairs. It appears to be exceedingly free-flowering and will probably prove to be a valuable border plant. The flowers, which are about the size of those of *C. amplexicaulis*, are of bright yellow colour and have a characteristic lobing of the pouch. Shown by Mr. CLARENCE ELLIOTT.

*Cistus cypricus immaculatus*.—This seems to be a very vigorous variety. It bears large white flowers which have a small, primrose-yellow zone. Shown by Sir WILLIAM LAWRENCE, Bt., Burford, Dorking.

#### FOR TRIAL AT WISLEY.

*Rose Abol*.—This is a well-formed, free-flowering H.T. variety. The blooms are fully double, milky-white with flesh-pink colouring in the centres of the blooms, which are pleasantly fragrant. Shown by the CHALK HILLS NURSERY CO.

*Dianthus Elizabeth*.—A very fine garden Pink. The flowers have the appearance of

miniature Florists' Carnations and are of rich orange-red colour, with a ray of small crimson spots.

*Dianthus Othello*.—This is a rather larger garden Pink and fully double. The flower is of rich crimson colour, flushed with dark maroon. Both varieties, which are fragrant, were shown by Mr. C. H. HERBERT.

#### GROUPS.

Delphiniums were the principal floral feature of the show, and these were shown in especial magnificence by Messrs. BLACKMORE AND LANGDON, who had tall, imposing stands filled with superb spikes of bloom. Their chief varieties were *Purple King*, of rich colour; *Phyllis*, bright lavender; *Mrs. Townley Parker*, pale blue; *Lord Derby*, reddish-mauve; *Constance*, sky-blue with white eye; *Blue Boy*, rich blue with white eye; and *Mrs. Colin McIver*, dull mauve.

On the other side of the entrance, Messrs. KELWAY AND SON had a large group of Delphiniums and Paeonies. The former included *Smoke of War*, *Sir Alfred Keogh* and *Rev. E. Lascelles*. The chief of the single Paeonies were *Globe of Light*, pink; *Sir Henry Stone*, rose; and *Moonlight*, white. Amongst the double varieties were *Dr. Bovania*, rose; *Langport Triumph*, blush; *Alsace*, ruby; and *General Buller*, deep rose. Mr. T. CARLILE had some good spikes of Delphiniums associated with *Gaillardias*. His Delphiniums included *Henley*, dark blue with white eye; *Triumph*, lavender; *Fair Lady*, pearly lavender; and *Madame A. Nonin*, pale blue.

In a well-arranged corner group, Messrs. M. PRICHARD AND SONS displayed many good Delphiniums with *Tritomas*, *Campanulas*, *Oriental Poppies*, *Heuchera* and a goodly collection of garden Pinks.

Delphiniums were well arranged with Paeonies and Irises by Messrs. R. H. BATH, LTD. Chief amongst the double Paeonies were *Sarah Bernhard*, pink; *Madame Emile Lemoine*, white; *Graziella*, cream, and *Madame Moutot*, rose. Their single varieties included *Abiah*, rose; *Aurora*, ruby; *Labades*, purple; and *Torpilleur*, pink.

The CHALK HILLS NURSERY CO. had an interesting collection of *Oriental Poppies*, *Delphiniums*, *Campanulas* and other seasonable border flowers. Messrs. WM. WOOD AND SONS also set up an attractive collection, in which *Astilbes*, *Geums*, *Armeria Bees' Ruby* and *Delphinium nudicaule* were prominent. In an exhibit by Messrs. G. AND A. CLARK, we noted some good *Eremurus*, *Campanulas*, *Scabiosas*, *Irises* and *Delphiniums*. A central stand of *Tricuspidaria Hookeri* in the display of Mr. G. REUTHE drew attention to various *Ericas*, an orange-coloured variety of *Azalea macrantha*, *Lupines*, *Dianthus* and various alpinas.

Mr. AMOS PERRY had a very attractively-arranged exhibit which contained a number of *Tritomas* of which the chief were *The Beacon*, *caulescens* and some elegant *gracilis* seedlings. He also showed a good batch of *Orchis foliosa*, and the uncommon *L. Washingtonianum*. In the centre of his group Mr. W. WELLS had a large stand of the graceful *Gypsophila Boston Fairy*, and also showed *Campanulas*, *Delphiniums* and *Erigeron Pink Pearl*. Several varieties of the dwarf *Thymus Serpyllum* were staged by Messrs. WATERER, SONS AND CRISP, and they also displayed dwarf *Musks*, dwarf *Campanulas*, and the blue *Moltkia petrea*.

In a collection arranged by Messrs. BAKERS, LTD., there were good spikes of *Delphiniums*, *Lychnis Viscaria splendens plena*, *Lupins* and *Giant Throat*.

An especially valuable collection of English Irises and late-flowering species was shown by Messrs. BARR AND SONS. The former included *Duchess of York*, of rich blue colour; *Prince Mauritz*, rosy-purple; *King Conrad*, purple and *Prince of Wales*, bright blue. The taller-growing Irises included *I. Monnier*, of rich colour; *I. monaurea*, bearing bright yellow flowers; *I. ochracea* and *I. ochroleuca Queen Victoria*. A large exhibit of seasonable border flowers was set up by Messrs. D. LADHAMS, LTD. In the centre there was a collection of the taller *Campanulas*, including the new variety

*Locarno*, bearing large, rounded, shining blue flowers. They also displayed vases of *Heucheras* in variety, *Betonica superba* and *Astrantias*. Messrs. STEWART AND SON showed English Irises, useful varieties of *Gladiolus Colvillei*, *Alliums* and a neat collection of alpinas. The Misses HOPKINS and Messrs. MAXWELL AND BEALE had seasonable rock garden exhibits, and the latter had various dwarf *Ericas* and *Kalmias*. Messrs. TUCKERS, LTD., showed *Delphiniums*, *Aquilegia pyrenaica*, *Primula capitata* and other useful hardy plants. *Delphiniums*, and garden Pinks were staged by Mr. H. G. LONGFORD.

In the Annexe, Mr. C. H. HERBERT had a delightful collection of his border Pinks, which included several of the varieties we admired at the Chelsea Show. Mr. J. KLINKERT showed *Topiary* specimens.

An interesting collection of *Liliums* was contributed by Messrs. WALLACE AND CO., who had *L. Martagon album*, *L. regale*, *L. japonicum* and *L. umbelliferum Sappho*. Mr. J. ROBINSON showed various rock plants, including dwarf *Thymes* and Pinks. Mr. W. J. UNWIN again set up an attractive exhibit of the variety *Coonara* of the Iceland Poppy.

An interesting collection of shrubs was staged by THE DONARD NURSERY CO. The chief feature was a collection of varieties of *Lep-tospermums* of considerable merit. They also showed *Tricuspidaria lanceolata*, *Ozothamnus rosmarinifolius* and *Escallonia*. Mrs. CARL HOLMES, The Node, Welwyn, exhibited a collection of *Gerbera Jamesonii* seedlings. Messrs. J. CHEAL AND SONS staged *Dahlia* blooms, chiefly of the *Star*, *Mignon* and dwarf *Decorative* types.

Sweet Peas of great merit were shown by Messrs. DOBBIE AND CO. In addition to the varieties *Hero*, *Sunkist*, *Prince of Orange*, *Camellia* and *Pinkie*, which we noted at the previous meeting, they had *Gleneagles*, a splendid lavender variety, and *Flamingo*, of brilliant orange-cerise colour. Messrs. S. BIDE AND SONS had a general collection of Sweet Peas, which included *Alma Beauty*, *Constance Hinton*, *Charming*, *King Mauve*, *Winifred McLaughton* and *George Shawyer*.

Small collections of *Roses* were shown by Messrs. B. R. CANT AND SONS, Mr. J. H. PEMBERTON and Messrs. GEORGE BUNYARD AND CO. The former included *Scarlet Climber*, *Pink Pearl*, *Cupid* and *Lemon Pillar*. Mr. PEMBERTON staged *The General*, *Francesca*, *Los Angeles*, *Vanity* and *Mrs. Henry Morse*, while the last-named again showed a valuable collection of old-fashioned *Roses*, including *Petite d' Hollande* and *cristata*, two pretty *Moss Roses*; the *Provence Rose* and *Cottage Maid*.

Carnations were staged by Messrs. C. ENGELMANN, LTD., who had good vases of *Topsy*, *Red Laddie*, *Peerless* and *Arnos Grove*, while Messrs. ALLWOOD BROS. had *George Allwood*, *Wivelsfield Apricot*, *Mary Allwood* and a collection of *Dianthus Allwoodii*. Several good vases of *Malmansons* were set up by Messrs. STUART LOW AND CO., who also showed *Brilliant*, *Eileen Low* and *Topsy*, of the perpetual type.

An especially well-arranged group of stove and greenhouse plants was displayed by Messrs. JOHN PEED AND SON. They had superb plants of *Dracaena Victoria*, various well-coloured *Codiaeums* (*Crotons*), many well-grown *Caladiums*, *Hydrangeas* and goodly groups of *Gloxinias* and *Streptocarpuses*.

A smaller but also a tastefully arranged exhibit of stove plants was made by Messrs. L. R. RUSSELL, LTD., who included highly coloured *Codiaeums*, *Medinilla magnifica*, *Anthurium crystallinum* and *Dracaena Victoria*.

A large space was well-filled by Messrs. SUTTON AND SONS with superb batches of *Streptocarpus*. The flowers were unusually large and of high quality. The plants were arranged in colour groups and of their *Giant* strain. The principal colours were blue, mauve, pink, deep pink, rose, purple and white.

The competition for the Mrs. E. Harding Cup was a little unfortunate in point of numbers, but the collection of W. B. CRANFIELD, Esq., East Lodge, Enfield Chase, which won the Cup, was of great merit. His six vases included

Claire Dubois, double pink; E. G. Hill, double rose; Orion, single ruby, and Emperor, single rose. Major J. CHURCHER, Beckworth, Lindfield, who was a good second, had valuable vases of Dr. Bretoimeau, double pale pink; Premivere, creamy-yellow; and Sarah Bernhardt, double rose. Sir WILLIAM LAWRENCE, Bt., Burford, Dorking, was third.

#### Fruit and Vegetable Committee.

**Present:**—Mr. C. G. A. Nix (in the chair), Mr. J. Cheal, Mr. H. S. Rivers, Mr. Geo. F. Tinley, Mr. T. Pateman, Mr. A. Metcalfe, Mr. Ed. Beckett, Mr. A. Poupard, Mr. E. A. Bunyard and Mr. A. N. Rawes (Secretary).

#### GROUPS.

Messrs. RIVERS and SON exhibited splendidly fruited pot fruit trees, including Peaches, Nectarines, Cherries and Figs. The Peaches were of the variety Peregrine, and the excellent little trees were splendidly cropped with fruits of choice quality. The Nectarines included Early Rivers and Lord Napier, whilst the Cherries comprised such excellent sorts as Ursula Rivers, May Duke and Belle d'Orleans.

The Rt. Hon. LORD LECONFIELD, Petworth Park, Sussex (gr. Mr. F. Streeter), showed twelve varieties of Melons very pleasingly arranged on stands and dishes decorated with foliage. The varieties included Matchless, Ideal, Everyday, Satisfaction, Delicacy, King George, Model, Lockie's Perfection, Jasper Queen, Peerless, Tender and True, and Constitution.

Messrs. LAXTON BROTHERS exhibited baskets of excellent Strawberries of the varieties King George, The Duke and Duchess of York.

#### UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

THE monthly meeting of this Society was held in the R.H.S. Hall, on Monday, June 13. Mr. T. R. Butler in the chair. Seven new members were elected.

Six members withdrew interest which amounted to £25 15s. 4d., and four members over the age of seventy years withdrew from their deposit accounts the sum of £122 1s. 8d. The sum of £169 8s. 11d. was passed for payment to the nominees of two deceased members.

The sick pay on the private side amounted to £65 12s. 8d., and on the State Section to £59 14s. 2d. Maternity claims totalled £7 10s. 0d.

Grants were made to twelve members for dental and optical treatment from the State section, amounting to £51 5s. 4d., and seventeen other cases were considered.

#### LEICESTERSHIRE AGRICULTURAL.

FOR the second year in succession there was an exhibition of horticultural produce in connection with the Leicestershire Agricultural Show, held at Leicester, on June 10 and 11, 1927. The show was opened by Prince Henry in exceptionally favourable weather, and there was a large attendance of visitors. The judges in the horticultural section were Mr. Jos. Smith, of Kings Heath Park, and Mr. J. G. Weston, Chatsworth Gardens.

The schedule comprised four classes. Class 1 was for a group of miscellaneous plants arranged for effect, occupying a space of three hundred square feet. The first prize of £20 was awarded to Mr. WM. HOLMES, of Chesterfield. Class 2 was for a collection of hardy perennial plants and cut blooms, excluding Roses and shrubs, and the first prize of £15 was won by Messrs. W. ARTINDALE and SONS, of Sheffield. In Class 3, for a collection of Sweet Peas, the first prize was awarded to Mr. ROBERT BOLTON, and in Class 4, Mr. C. VICKERS, of Leicester, was first, his collection of cut Roses winning the premier award.

Besides the classes for competition, there were numbers of fine non-competitive groups. Large Gold Medals were awarded to Messrs. JOHN WATERER, SONS and CRISP for Rhododendrons and flowering plants; and to Messrs. ALEX. DICKSON and SONS, of Belfast, for an exceptionally fine collection of Sweet Peas.

Gold Medals were awarded to Messrs. ALLWOOD BROS., Messrs. BAKERS, of Codsall; Messrs. DANIELS, of Norwich, and Mr. C. VICKERS; while Silver Medals were won by Messrs. HEWITT and Co., Solihull, for Delphiniums and Lupins; Mr. R. V. ROGER, Pickering, for a miniature alpine garden; and Mr. H. N. ELLISON, of West Bromwich, for exotic Ferns.

#### Obituary.

**Job Ash.**—We regret to learn that Mr. Job Ash, who was gardener to the Dean and Canons of Windsor for forty-three years, died last week. Mr. Ash had served four Deans of Windsor, and he took special pride in the famous Cedar on the lawn of the historic Deanery garden, near the Castle, and in a Willow, which is said to have been raised from a cutting taken from a tree on the battle-field of Waterloo.

**Thomas Main.**—The death took place, at Glasgow last week, of Mr. Thomas Main, who has long been associated with horticultural trading interests in this country. In his early years he was in the employment of Messrs. Alex. Cross and Sons, Ltd., Glasgow, then he became a member of the firm of Messrs. Williamson, Main and Guinnell, seed merchants, Glasgow, and subsequently started business on his own account as a nurseryman at Bowling. Thereafter he was appointed London representative of Messrs. Cross and Sons, but more recently he worked up a good connection among growers in the Leigh Valley and the Channel Islands for his own fertilising products. Deceased was about seventy-two years of age.

**George F. Moore, V.M.H.**—We deeply regret to record the death, on the 19th inst., of Mr. George F. Moore, of Chardwar, Bourton-on-the-Water, Gloucestershire, within a week of his seventy-second year. Deceased was one of the most successful amateur cultivators of Orchids, and his fine exhibits of these plants at the R.H.S. meetings will long be remembered. Cypripediums were his special favourites, and with them he reaped many successes. At the R.H.S. meeting on November 27, 1923, no fewer than four First-Class Certificates were awarded to as many hybrids from his collection, and at the following meeting three more were obtained. Mr. Moore was first attracted to the beauties of Orchids when residing in India in 1874. He recently presented to the R.H.S. the Gold Medal bearing his name, to be awarded annually to the finest Cypripedium shown during the year. Possessed of a charming disposition, and at all times very generous in distributing his plants, Mr. Moore was a universal favourite, and his presence will be sadly missed by a large number of horticultural enthusiasts.

**James Ward.**—An outstanding figure in forestry circles in the North of Scotland has passed away in the person of Mr. James Ward; who for over half-a-century had charge of the northern portion of the extensive Seafeld estates, with headquarters at Keith. Mr. Ward was eighty-two years old; he was a native of County Wicklow, Ireland, where in 1866 he became an apprentice under Mr. Charles S. France, that wonderfully alert and keen old forester, who still takes a prominent part in the affairs of the Aberdeen Branch of the Royal Scottish Arboricultural Society. Mr. France was then in charge of Powerscroft estates, Co. Wicklow. From Powerscroft, Mr. Ward went to serve under Mr. France's father, who was then head forester on the Culzean estate of the Marquis of Ailsa, in Ayrshire. From thence he went to the Abernethy district of the Seafeld estates on Speyside, later being appointed forester to the Marquis of Drogheda, County Kildare, and subsequently took up a similar position to the Earl of Glasgow, at Hawkhead, Paisley. His lifework, however, was on the Seafeld estates, where he took up his permanent abode in 1876, and for many years acted as head forester, land steward and overseer. A very keen and skilled forester, and with some of the finest forests in this

country under his charge, Mr. Ward did yeoman service to the Earls of Seafeld. Under his charge, huge areas on the northern side of Balloch Hill, near Keith, were entirely afforested and many other big schemes were carried out under his direction. The exquisite sylvan beauty of this district at the present day owes much to James Ward, and it is not surprising to learn how thoroughly he gained and retained the confidence of his noble employers during the past half-century. Mr. Ward became a member of the Royal Scottish Arboricultural Society in 1867, and had been associated with the Aberdeen branch of that Society since its inception in 1906. He took a prominent part in the work at Aberdeen, and was a member of committee for the past ten years. Mr. Ward had many friends all over Scotland and Ireland who will regret to hear of his demise. Mr. Ward fulfilled his duties ably and well, and during his long sojourn in Scotland became one of the most highly esteemed members of the woodman's craft in the northern half of Scotland. He also took a warm interest in public affairs, identifying himself with all matters pertaining to the welfare of those around him and taking a prominent part in the work of public bodies. Mrs. Ward died about a year ago, and two sons and two daughters survive. The sons are rubber planters in Borneo and Siam. The funeral took place at Keith Churchyard, on Friday, the 17th inst.

#### ANSWERS TO CORRESPONDENTS.

**SALVIA SPLENDENS.**—A. H. H. (1) *Salvia splendens* requires a good root-run, thus you must get your plants into larger pots; you should pot them on as they require it until they are in eight- or nine-inch pots, keeping them well fed when the pots are full of roots. At least, such is the treatment required by the type and the large-growing varieties. The dwarf forms, as represented by Harbinger and Glory of Zurich, make good specimens in six- or seven-inch pots, and come into flower much earlier. The large-growing varieties should be stopped about twice during the growing season. (2) You can lift the *Camellia* from outdoors and place it in a suitable-sized pot or tub. A suitable compost should consist of one half loam and one half fibrous peat and leaf-soil, with enough sand to keep it open and porous; if the loam is heavy, you can use more peat with advantage; on the other hand, a light loam will require less. Pot firmly and keep the plant in close conditions for a time until it is established.

**THE JAPANESE CHERRIES.**—W. T. C. (1) *Prunus sinensis pendula rosea* = *P. subhirtella* var. *rosea*; *Hisakura* = *P. serrulata* var. *Sekiama*; *Ama-no-gawa* = *P. serrulata* var. *erecta*; *lutea flore pleno* = *P. serrulata* var. *grandiflora*; *japonica rosea plena* = *P. japonica* var. *flore roseo pleno*; *Shirofugen* = *P. serrulata* var. *albo-rosea*. The true *P. Sieboldii* is very distinct, the leaves and flower stalks being hairy. It is often called Waterer's Cherry. The pale pink blossoms, fairly large and semi-double, are very freely borne on small trees. There are several forms of Siebold's Cherry. Send a specimen of your *rosea superba* form to Mr. C. Ingram, The Grange, Benenden, Kent, when in flower, next year. (2) The following are all included in the *Malus* Section of *Pyrus*: *Pyrus arnoldiana* is a hybrid, *P. floribunda* × *P. baccata*; *P. aldenhamensis* is a hybrid, *P. floribunda* × *P. Niedzwetzkyana*; *P. Eleyi* is a hybrid, *P. spectabilis* × *Niedzwetzkyana*; *P. Elwangeriana*, an American variety of uncertain origin; *P. tifeira*, a Chinese species; *P. toringoides*, introduced from China by Mr. E. H. Wilson, was originally described as a variety of *P. transitoria*; *P. ioensis flore pleno*, The Bechtel Crab, has double, pink-violet, scented flowers. (3) *Pyrus Aria* var. *lutescens* is a white Beam with yellow-shaded foliage.

REMARKS.—Supplies of all outdoor blooms are on the increase. Scabiosa caucasica is the latest arrival. Blue

and pink Cornflowers are cheaper and finer in quality. A good selection of Delphiniums is on offer, but supplies are more than sufficient for present requirements. Of Pyrethrum, the double white varieties are most saleable; coloured sorts are now very poor in quality. A larger supply of white and mauve Stocks is greatly welcomed, and their prices are much easier. White Pinks, Mrs. Sinkins and Her Majesty, have also increased in quantity during the past week. Carnations and Roses continue to arrive in fine condition, and their prices have been somewhat easier. The white Rose, Molly Sharman Crawford, is again more plentiful. The supplies of Gardenias are very limited. Giant-flowered Gladioli as well as Primulinus varieties are excellent in quality, and include various shades of pink, also some very fine spikes of scarlet and white sorts. Sweet Peas vary in price from 4/- to 18/- per dozen bunches; the finest quality blooms are soon cleared. Spanish Irises begin to show signs of finishing; a few boxes of Anglica Irises have been on offer during the past week, but the former are preferred while in fair condition. Lilium longiflorum continues to arrive in good condition, and this morning its price was unchanged. More of the white and pink L. lancifolium have been on sale. The quantities of Lily-of-the-Valley have been below requirements during the past week.

REMARKS.—Trade in most sections of the market continued brisk and about normal for the season. Strawberries usually dominate the market at this time of the year, but, so far, they have not had the retarding effect on the sales of other produce as they usually do. This is probably due to the comparatively short crop from Southampton and the correspondingly high prices they are realising. Choice fruits, such as Peaches, Nectarines, Melons, Grapes and Figs are a moderately good trade with a steady price level. Apples are quoted higher and sell well at the increased prices. The importation of Cherries from France having been prohibited, English Cherries which are now being marketed should find a keen demand. Home grown Gooseberries sell badly, the quantity available being much less than a week ago. Spanish Plums also are meeting a good market. Black Currants from France are available and sell fairly well. There are also a few Black Currants from home-growers. Forced Beans are not quite so popular now that Peas are on the market. Asparagus is not finishing the season at all well and prices are

very low. Mushrooms are not quite so plentiful as hitherto, and their prices are inclined to improve. New Potatoes continue to be a firm trade. Tomatoes are plentiful and cheap. The Cucumber trade is not good at the time of writing, and prices have a tendency to fall. Peas are in better supply, but rain is wanted badly to improve them. Salads sell fairly well, but are comparatively cheap. The green vegetable trade is moderately good.

## GLASGOW.

Business in the cut flower market was quieter during the past week, and the tendency of prices was towards a lower level, except in the case of Irises, which were unchanged at 1/- to 1/3 per bunch for yellow and white 10d. to 1/3 for Imperator and 1/- for Anglica. Richmond and Mensing Roses were worth 1/- to 2/6 per dozen; Mrs. H. Stevens, 2/-, and Madame Butterfly, 2/- to 3/-; Red Gladioli realised 1/- to 1/3 (6's); Hermione, 6d. to 8d.; Prince of Wales, 1/- to 1/4; and Maiden's Blush, 10d. to 1/2. Carnations Lady Northcliffe, Margaret, Aviator and Brilliant sold for 2/- to 3/- per dozen. Anemones made 3/-. Sweet Peas, 8d. to 1/- per bunch, special ones made 1/6 to 1/9; Paeonies, 1/6 (6's); Lilium longiflorum (Harrisall), 2/- to 3/-; Queen Mary Pyrethrum, 9d. to 1/-; single pink Pyrethrum, 9d.; and single scarlet, 6d. to 8d.

With the exception of Geraniums and Chrysanthemums, pot and bedding plants continued to be plentiful. Geraniums ranged from 18/- to 24/- per dozen; bedding, 8/- to 10/-; Fuchsias in five-inch pots made 12/- per dozen, bedding Fuchsias, 4/-; Begonias, 5/6; Hydrangeas, 9/- to 27/-; Marguerites, 9/- to 12/-; Gladioli, 4/- per box; Coltness Gem Dahlias, 2/- to 2/6 per dozen; and Chrysanthemums, 4/-.

A feature of the fruit market was the cheap price of Valencia Oranges, which ranged from 5/- to 20/- per case; Murcias were dearer at 23/- to 43/-; Sunkist realised 32/-; and South African Navel Oranges, 29/-. Grape Fruit was worth 30/- to 32/-. Prices of English Strawberries fluctuated between 1/- and 1/4 per lb. Green-gages realised 14/- per crate; Apricots, 10/-; Black Currants, 15/- half bushel; Cherries, 16/-; Kelsey Plums, 17/-; Cherry Plums, 8/- to 9/-; and Gooseberries, 5/- to 7/-. Scotch Tomatoes made 10d. to 1/- per lb., and Guernsey, 9d. Black Grapes realised, 2/- to 2/3 per lb.

In the vegetable section Cucumbers realised 5/- to 7/- per dozen; Scotch-grown Lettuces, 2/- to 3/- per dozen; Dutch Lettuces, 4/6 per crate (30's); Asparagus, 4/-; Carrots, 1/- per bunch; Turnips, 1/1 to 1/4; and Italian Potatoes, 3/- per stone.

## ENQUIRY.

I HAVE a duck pond in which I intend to plant wild Celery as this is supposed to be good for encouraging wild duck to the pond. I have the seed, and shall be glad if any reader will tell me how to sow it and treat it before being planted in the pond. D. L.
